

Sales Analysis — Attribution Check & Requirements Review

Sales Forecasting & Analysis · YTD January–August 2026 vs 2025 · Prepared against the Sales Analysis Requirements brief · September 2026

This works through the Sales Analysis Requirements brief in the order it was written: the attribution check first, since that was the specific claim flagged for validation, then each level of analysis it asks for, then the full list of questions to consider, answered one by one rather than folded into prose where they'd be easy to skim past. Everything below comes from live billing data and the account–industry mapping, and every number that could be cross-checked against a second, independent cut was.

Attribution Check

The brief poses a specific claim: customer connections are increasing while electricity sales are declining, which it reads as a decoupling of customer growth from revenue growth and a structural shift in demand. That's a testable statement, so it's worth starting there before touching anything else. Because "customers" and "sales" mean very different things across the customer base, the check below is split four ways — residential customers billed monthly, prepaid customers, commercial customers, and then the combined system view the brief's claim was actually made about.

Residential — billed monthly (homes and small residential-type accounts)

Metric	Aug 2025	Aug 2026	Change
Customers	684,552	694,028	+9,476 (+1.38%)
Sales (GWh, month)	132.24	138.26	+6.01 (+4.55%)
Sales YTD (GWh, Jan–Aug)	952.4	903.1	−49.3 (−5.17%)
Revenue YTD (J\$M)	55,025	53,511	−1,513 (−2.75%)

This is where nearly all the customer growth in the system-wide numbers actually comes from, and it's also where the "growth" is least real. Of the 10,308 net new homeowner-tariff accounts this year, 7,399 — seventy-two cents of every new dollar of "growth" — are premises that are connected and billing exactly zero. The small-business tariff shows the same thing at a smaller scale, 58% of its growth. The most plausible read, given the timing, is Hurricane Melissa: homes and small businesses that were damaged or vacated in November 2025 and are still on the books but haven't been reactivated. That's an inference from the timing, not something confirmed directly in the billing data, but it's the only explanation that's consistent with everything else this analysis turned up. Volume tells a more encouraging in-month story than the year-to-date figure suggests — August itself is up about 4.5% year over year, and customers are migrating into *higher* consumption bands over this period, not lower. The year-to-date shortfall is concentrated in the western parishes that took the storm — Westmoreland down 30.5% in volume, St. Elizabeth 21.7%, Hanover 13.4%, Trelawny 12.0%, St. James 10.9% — while the east and centre of the island are flat to slightly up (Section 4). That is a recovery-lag pattern, not a fading trend.

Prepaid (pay-as-you-go)

Metric	Aug 2025	Aug 2026	Change
Customers	16,574	18,488	+1,914 (+11.55%)
Sales (GWh, month)	2.68	3.22	+0.55 (+20.35%)
Sales YTD (GWh, Jan–Aug)	18.6	20.1	+1.5 (+8.19%)
Revenue YTD (J\$M)	1,034	1,194	+160 (+15.49%)

Prepaid is the only residential segment growing on every measure, and it's growing much faster than the rest of the residential base: customers up 11.5% against 1.4% for monthly-billed residential, volume up 8.2% year to date and 20.3% in August alone, revenue up 15.5%. It is still small — about 2.5% of customers, 1% of volume and 1% of revenue — and prepaid customers use somewhat less per head (about 174 kWh in August against roughly 199 for monthly-billed). The pattern is consistent with households moving to prepaid for budget control, though the billing data can't confirm the reason for the switch. Worth tracking, since it is also the segment with the least visibility into what a customer is paying for (see Data Gaps).

Commercial (registered businesses, individually metered)

Metric	Aug 2025	Aug 2026	Change
Customers	26,134	26,066	-68 (-0.26%)
Sales (GWh, month)	172.08	162.48	-9.60 (-5.58%)
Sales YTD (GWh, Jan–Aug)	1,277.3	1,211.0	-66.3 (-5.19%)
Revenue YTD (J\$M)	58,487	57,726	-761 (-1.30%)

The opposite pattern from residential: the connection count is essentially flat (down slightly), and the volume decline is real, not a labeling artifact — but it traces to two specific, nameable events, not a diffuse trend. Alcoa Minerals' self-generation came fully online in August, and that grid draw isn't coming back. Separately, the hotel sector still hasn't finished recovering from Melissa — it's improving month over month, just not there yet. Between those two, most of the commercial decline has an address. Outside of them, this segment isn't shrinking on either count or usage. Commercial revenue also held up far better than commercial volume (down 1.3% against 5.2%) because demand charges are billed on peak kVA rather than kWh — see Section 1b.

Combined (system-wide, matching the brief's framing)

Metric	Aug 2025	Aug 2026	Change
Customers	727,260	738,582	+11,322 (+1.56%)
Sales (GWh, month)	307.00	303.96	-3.04 (-1.0%)
Sales YTD (GWh, Jan–Aug)	2,248.2	2,134.2	-114.0 (-5.1%)
Revenue YTD (J\$M)	114,545	112,431	-2,114 (-1.85%)

The three segments above add exactly to these combined figures (Appendix, Table A1). Customer counts run about 23,500 higher in both years than earlier cuts of this same total — that's the small-business accounts that are individually metered, which weren't being added into the system-wide headcount before. Including them doesn't change the growth rate (still about +1.6%), since that population is close to flat year over year; it just corrects the base.

Both halves of the brief's claim are literally true — customers are up, sales are down, every month this year bar two. But "structural shift" is doing more work in that sentence than the data supports, and splitting the segments apart shows why.

Nearly all the customer growth is residential, and most of it isn't really customers — it's inactive connections still on the books after Melissa. Nearly all the volume decline is commercial, and it isn't diffuse — it's two accounts — plus a residential shortfall that sits in the storm-hit western parishes. Prepaid, the one segment growing on every measure, is too small yet to move the total. And the one thing that would actually indicate a structural shift — existing customers using less — doesn't show up anywhere: residential volume is up in-month and migrating into higher consumption bands, and commercial volume outside of Alcoa and the hotel sector is holding steady. That's the opposite of what conservation, efficiency gains, or broad self-generation would look like if it were driving this.

Bottom line for how this gets written up: don't frame it as customer growth decoupling from revenue growth. Frame it as sales growth lagging customer growth because of two identifiable, largely temporary or single-account events on the commercial side, sitting on top of a residential customer count that's partly inflated by inactive connections. That's a very different message to leadership than "something structural is happening to demand."

1. Top Level

Overall, sales are down 5.1% year to date and customers are up 1.6%. Revenue held up much better than volume — down only 1.85% — because the average rate paid per kWh rose 3.4% across the period and absorbed most of the volume shortfall. It's worth remembering that the 2025 base itself isn't a clean baseline: it was already running below normal from November onward because of the storm, so part of this year's "decline" is really "hasn't caught back up yet" rather than fresh deterioration on top of a healthy prior year.

1b. Revenue composition — what is actually moving

Revenue is billed in layers that behave very differently: the non-fuel charges (customer charge, energy charge and, for commercial customers, the demand charge on peak kVA) are the part JPS keeps to run the network; fuel and IPP purchased power are largely passed through; taxes (GCT) sit on top. Separating them shows that the headline revenue decline is not one thing.

Combined

J\$M, Jan–Aug	2025	2026	Change	Share, 2026
Non-fuel charges (customer + energy + demand)	36,088	34,604	–1,484 (–4.1%)	30.8%
Fuel	53,224	56,778	+3,554 (+6.7%)	50.5%
IPP (purchased power)	22,404	19,214	–3,190 (–14.2%)	17.1%
Other (billing adjustments, credits)	1,795	641	–1,154 (–64.3%)	0.6%
Prepaid (not split by component in the source)	1,034	1,194	+160 (+15.5%)	1.1%
Net revenue (before GCT)	114,545	112,431	–2,115 (–1.85%)	100.0%

Three movements explain the net J\$2.1 billion decline. IPP is down J\$3.2 billion (–14.2%) and non-fuel charges are down J\$1.5 billion (–4.1%), against a J\$3.6 billion increase in fuel (+6.7%) that cushions them. Fuel and IPP move in opposite directions but together they are up just 0.5% on 5% less volume, so read the pair as one pass-

through block; the individual lines swing from month to month. The line to watch is "Other", which fell from J\$1.8 billion to J\$0.6 billion and on its own accounts for more than half of the net decline — it is a residual of billing adjustments and credits rather than a charge, and a drop of that size in a single year is worth confirming with Billing before it's treated as either real or permanent.

Residential — billed monthly

J\$M, Jan–Aug	2025	2026	Change	Share, 2026
Non-fuel charges (customer + energy + demand)	18,046	17,386	–659 (–3.7%)	32.5%
<i>Customer charge</i>	3,584	3,612	+28 (+0.8%)	6.7%
<i>Energy charge</i>	14,462	13,775	–687 (–4.8%)	25.7%
Fuel	23,918	25,193	+1,275 (+5.3%)	47.1%
IPP (purchased power)	12,702	10,733	–1,969 (–15.5%)	20.1%
Other (billing adjustments, credits)	358	198	–160 (–44.7%)	0.4%
Net revenue (before GCT)	55,025	53,511	–1,513 (–2.75%)	100.0%

Commercial

J\$M, Jan–Aug	2025	2026	Change	Share, 2026
Non-fuel charges (customer + energy + demand)	18,042	17,218	–824 (–4.6%)	29.8%
<i>Customer charge</i>	390	411	+21 (+5.3%)	0.7%
<i>Energy charge</i>	8,876	8,463	–413 (–4.7%)	14.7%
<i>Demand (kVA) charge</i>	8,776	8,343	–432 (–4.9%)	14.5%
Fuel	29,305	31,585	+2,279 (+7.8%)	54.7%
IPP (purchased power)	9,702	8,480	–1,222 (–12.6%)	14.7%
Other (billing adjustments, credits)	1,437	443	–994 (–69.2%)	0.8%
Net revenue (before GCT)	58,487	57,726	–761 (–1.30%)	100.0%

Commercial non-fuel charges fell 4.6% against a 5.2% fall in volume, and the reason is in the demand line. Demand charges are billed on peak kVA, not on kWh, and a customer's peak doesn't fall in proportion to its total consumption: a plant that runs less often still hits the same peak when it does run. Across the three demand-billed classes (RT40, RT50, RT70) volume is down 6.3% year to date and the energy charge is down 6.3% right alongside it, but the demand charge is down only 4.9% and billed kVA only 5.9%. That gap is why commercial revenue (–1.3%) is so much more resilient than commercial volume (–5.2%).

Demand-billed classes, Jan–Aug	kWh	Billed kVA	Energy charge	Demand charge
RT40 Commercial	–6.3%	–4.2%	–6.3%	–3.8%
RT50 Large Commercial	–9.6%	–6.2%	–9.4%	–7.5%
RT70 Industrial	–2.2%	–9.1%	–2.2%	–5.6%
All three	–6.3%	–5.9%	–6.3%	–4.9%

The clearest single example is RT70 in August, where volume fell 28.4% (Alcoa's exit) yet billed kVA rose 61% and the demand charge rose 11.7%. That is what you would expect from a customer that now generates most of

its own power but still holds grid capacity for backup, though the billing data alone can't confirm that is what is happening.

Taxes (GCT)

GCT billed, Jan–Apr (J\$M)	2025	2026	Change	Effective rate 2026
Residential — billed monthly	770	611	−159 (−20.7%)	2.5%
Prepaid	33	39	+5 (+16.0%)	7.3%
Commercial	3,683	3,681	−2 (−0.1%)	13.3%
Total	4,486	4,331	−156 (−3.5%)	8.3%

Tax is shown for January to April only. The tax amounts for the larger commercial classes (RT40, RT50, RT60-ST, RT70) have not been loaded for May, July and August 2026, so a full year-to-date tax comparison isn't possible yet (Data Gaps). Residential tax is falling faster than residential revenue (−20.7% against −8.1% over the same four months); that fits tax applying mostly to higher-consumption bills, but it hasn't been checked against the tariff schedule.

2. Across Rate Class

Class	GWh Δ	Customers Δ	kWh/cust Δ	Revenue Δ	J\$/kWh Δ
RT10 Residential	−3.9%	+1.6%	−5.4%	−1.1%	+2.9%
RT20 Small Commercial	−4.0%	+2.2%	−6.0%	−2.7%	+1.3%
RT40 Commercial	−6.3%	+0.5%	−6.8%	−1.4%	+5.2%
RT50 Large Commercial	−9.6%	+0.6%	−10.2%	−7.6%	+2.3%
RT60-ST Street Lighting	−10.7%	0.0%	−10.7%	−9.8%	+1.1%
RT70 Industrial	−2.2%	−12.5% (3 accts)	+11.8%	+4.3%	+6.7%

Every class lost volume and every class gained rate — that part is uniform. RT70 is the one that looks odd at first glance, revenue actually up despite less electricity sold, but it's mechanical rather than encouraging: losing three accounts including Alcoa, one of the largest and presumably one of the cheaper-rate loads on the system, pulls the average rate of everyone who's left upward. It's a mix effect, not industrial customers suddenly paying more for the same power.

3. Within Rate Class — Consumption Blocks

This is where the attribution check's real answer lives, so it's worth walking through carefully. RT10 and RT20 are the only two classes with banded consumption data, and both tell the same story: the Under-150 and 150–350 kWh bands are shrinking while every band above 350 kWh is growing. Concretely, for RT10 the two lowest bands lost 6,762 customers combined while the four bands from 350 kWh up gained 7,570 — more customers moved up than moved out of the low end, which means the migration is being topped up by some new connections landing directly in the middle bands too, not just by existing low-usage customers climbing. Either way, the direction is up, not down. The full band tables for every rate class are in the Appendix (Tables A2–A4).

	RT10	RT20 (residential)
Zero-consumption customers, Aug-25 → Aug-26	50,569 → 57,968 (+7,399, +14.6%)	5,712 → 6,340 (+628, +11.0%)
Share of that class's total customer growth	72%	58%
Registered net-billing customers, Aug-25 → Aug-26	486 → 511 (+25, +5.1%)	301 → 313 (+12, +4.0%)
Customers exporting more than they draw in the month, Aug-25 → Aug-26	768 → 966 (+198, +25.8%)	67 → 106 (+39, +58.2%)

So the falling per-customer average isn't existing customers pulling back — it's the blended average getting diluted by a large number of connections that aren't consuming anything at all. That's a meaningfully different problem to solve than "customers are conserving," and it points toward a data-cleanup and reconnection question (are these premises actually vacant, or just stuck in a billing/meter-read backlog?) rather than a demand-forecasting one.

Solar shows up in two different ways in the data, and they tell different stories. Customers registered on the net-billing tariff are few and barely growing — about 510 on the residential tariff and 313 on the small-business tariff, up roughly 4–5% in a year, with another 65 large commercial accounts that haven't moved. But the number of customers who actually exported more than they drew in August is close to double the registered residential count (966 against 511) and grew five times as fast (+26%). At least 450 residential exporters are therefore not on the registered scheme, or not yet; that's the activity the brief asks about that sits outside registered net billing. Either way it's still small in absolute terms — about 1,100 customers — but the direction is clear and the registered count understates it. One caution: a single month of net export can also come from a meter correction or a billing estimate reversal, so the export count is an upper bound on solar, not a precise measure.

4. By Parish

Earlier drafts flagged that only about one in ten customers carried a parish, and that the residential base had none. That turned out to be a limitation of how the residential data is stored, not of the billing itself: every residential account carries a parish in the source billing records, and it was being combined into a single island-wide total on the way into the sales platform. This section now uses the source records directly, so residential is included. What is still not available is the consumption-band view by parish (Section 3 and Appendix A2 are island-wide), which needs the band feed rebuilt at parish level.

Residential (billed monthly), by parish — sorted from steepest volume decline

Parish	Customers, Aug-26	Customers Δ	GWh, Jan–Aug 26	GWh Δ	Revenue Δ
Westmoreland	33,153	+1.4%	25.0	−30.5%	−28.8%
St. Elizabeth	43,806	+1.6%	32.2	−21.7%	−19.9%
Hanover	15,927	+1.0%	16.2	−13.4%	−10.8%
Trelawny	19,873	+1.9%	18.9	−12.0%	−9.2%
St. James	58,520	+1.0%	68.0	−10.9%	−8.6%
St. Ann	47,810	+2.1%	50.6	−4.9%	−2.1%
Manchester	45,428	+1.4%	42.0	−2.0%	+0.8%
St. Mary	31,532	+1.2%	32.7	−0.3%	+2.7%
Portmore	51,595	+1.6%	70.5	−0.2%	+2.6%
Clarendon	48,218	+1.5%	45.7	+0.1%	+3.0%
St. Catherine	80,215	+1.6%	91.9	+0.8%	+3.6%
KSAN	80,016	+1.0%	150.9	+1.1%	+3.8%
KSAS	44,649	+0.5%	62.5	+1.3%	+4.5%
Portland	22,843	+1.3%	22.4	+1.5%	+4.6%
St. Thomas	20,142	+0.3%	19.1	+3.0%	+6.0%
Total	643,727	+1.3%	748.7	−4.2%	−1.5%

Customer growth is even across the island, between 0.3% and 2.1% everywhere, but volume is not. The five steepest declines — Westmoreland, St. Elizabeth, Hanover, Trelawny and St. James — are the western parishes hit hardest by Hurricane Melissa, and they account for the whole of the residential volume shortfall; the east and centre are flat to slightly up. It's the same geography as the hotel story in Section 5, showing up on the residential side: connections are back or holding, consumption in the storm-hit areas isn't yet.

Commercial accounts (RT20 commercial, RT40, RT50, RT60-ST, RT70) carry a parish on essentially every record and show the same western pattern — St. James down 23.6% in GWh, St. Elizabeth down 20.5%, Westmoreland down 17.3%.

5. By Sector / Industry

This covers the commercial classes (small-business commercial RT20, RT40, RT50 and RT70). RT10 residential and RT60-ST street lighting carry no industry tags, so they are excluded here by definition, not by choice. Figures are January to August.

Top 10 industries by 2026 volume

Industry	GWh 2025	GWh 2026	GWh Δ	Share of commercial GWh, 2026	Revenue Δ
1. Water Supply and Irrigation Systems	155.1	139.4	-10.1%	11.7%	-4.7%
2. Hotels (except Casino Hotels) and Motels	173.3	128.3	-26.0%	10.8%	-20.1%
3. Other Metal Ore Mining	75.4	77.7	+3.0%	6.5%	+6.7%
4. Cement Manufacturing	60.3	73.4	+21.8%	6.2%	+21.2%
5. Wired and Wireless Telecommunications Carriers	57.3	54.0	-5.8%	4.5%	-2.8%
6. Executive Offices	42.6	41.2	-3.4%	3.5%	-0.8%
7. Full-Service Restaurants	37.7	37.2	-1.2%	3.1%	+2.6%
8. Banking, Insurance and Investments	35.1	33.7	-3.9%	2.8%	-0.5%
9. Food Manufacturing	29.3	29.9	+1.9%	2.5%	+6.1%
10. Supermarkets and Other Grocery Retailers	29.2	29.7	+1.5%	2.5%	+6.2%
All other tagged industries	411.5	393.3	-4.4%	33.1%	+0.2%
No industry tag	143.5	149.2	+4.0%	12.6%	+5.9%
Total commercial	1,250.3	1,186.9	-5.1%	100.0%	-1.0%

The top ten tagged industries make up 54% of commercial volume, another 33% is spread across the remaining tagged industries, and about 13% has no industry tag at all. An earlier version of this section put the untagged share at 22%; that figure was too high because it counted residential small-business accounts, which can't carry an industry tag, in the "no tag" bucket. On the commercial accounts that should carry one, the gap is 12.6% of volume in 2026 (11.5% in 2025). It is also not evenly spread: it sits almost entirely in small-business commercial accounts, where 56% of volume (145 of 260 GWh) is untagged, against under 1% for RT40, RT50 and RT70. By premise count that is roughly 17,900 accounts. A targeted tagging cleanup on the small-business file would close nearly all of it.

Biggest movers

Industry	GWh Δ	Revenue Δ
Hotels (except Casino Hotels) and Motels	-26.0% (173.3→128.3)	-20.1%
Water Supply and Irrigation Systems	-10.1%	-4.6%
Poultry Hatcheries	-23.3%	-19.8%
Telemarketing / Contact Centers	-22.7%	-18.5%
Cement Manufacturing	+21.8%	+21.2%
Distilleries	+17.5%	+18.2%
Other Metal Ore Mining	+3.0%	+6.7%

Hotels is, by a wide margin, the single largest identifiable industry drag on the system — more GWh lost than the next three declining industries combined. Everything else tagged in the crosswalk mostly moves within a few percent either direction, so this reads as concentrated in one sector rather than a broad commercial slowdown.

5a. Composition — is a rising share growth, or everyone else declining?

The brief specifically asks whether a higher revenue or volume share for an industry reflects real growth or just other industries falling faster around it. Worth separating those two cases, because they read very differently to a board.

Industry	Share of commercial GWh, 2025	Share, 2026	Read
Hotels	13.86%	10.81%	Share falling — genuine decline, not dilution
Cement Manufacturing	4.82%	6.18%	Share rising , volume also up 21.8% — real growth
Other Metal Ore Mining	6.03%	6.55%	Share rising despite Alcoa's August exit — other accounts in the group (Windalco, Jamalco, Alpart) are carrying it, and Alcoa's drop has only been in the data one month so far
Water Supply and Irrigation	12.41%	11.74%	Share and volume both down modestly — broad, not company-specific
(no industry tag)	11.47%	12.57%	Share rising slightly, because the untagged small-business accounts fell less than the tagged ones — a tagging gap more than a finding

Cement Manufacturing is the one genuinely clean growth story here: both the dollars and the share are moving up together, which is what real growth looks like rather than growth-by-comparison. Hotels is the mirror image — an outright decline, not just a shrinking share because other things grew around it. And about one kWh in eight still has no industry attached, concentrated in small-business accounts, which caps how far the sector cut can be trusted until that is cleaned up.

5b. Concentration — how much of this sits with a handful of accounts?

Taking RT50 as the sharpest example, since it has the steepest volume decline of any class: the five accounts that lost the most volume year over year were four hotel properties and Caribbean Cement, while the five biggest gainers — NFE North Holdings, Half Moon Bay, West Meat Packers, Windalco, National Insurance Fund — don't come close to offsetting them in scale. That's the pattern across every class this analysis touched: the movement is a small number of large accounts, not a broad shift across the customer base.

Questions to Consider

How are we performing from a sales perspective? Growing, declining, or flat?

Declining in volume (−5.1% YTD), growing in customer count (+1.6%), close to flat in revenue (−1.85%, cushioned by the rate increase). See Section 1.

What customer class is driving sales and peak-demand changes? What are the drivers? Where are the shortfalls?

RT50 and RT60-ST have the steepest percentage volume declines; RT70 has the steepest customer-count decline, concentrated in one account. See Section 2.

Which customers explain the gains? Do these reflect business growth, new accounts, return to the grid, or billing adjustments?

Mostly new connections in count terms, but a large share of those are zero-consumption (Section 3), so they're not really adding load. The gains that do reflect real business growth are concentrated in a handful of named accounts — Caribbean Cement, Distilleries — and in the upward migration of existing residential customers into higher bands, not broad-based growth across the customer file.

Which customers explain lost sales? What is the cause, and when is demand expected to return, if so?

Two causes cover nearly all of it: Alcoa's self-generation (RT70, permanent, not returning) and the hotel sector's still-incomplete Hurricane Melissa recovery (temporary, closing gradually month over month).

Where a rate class shows net growth or net decline overall, is that outcome driven mainly by new connections and closures rather than by existing customers, and could that be masking an underlying decline (or growth) among the existing customer base?

Yes, and this is the central finding of the whole exercise. Existing RT10 and RT20 customers are genuinely using more, moving into higher consumption bands, but that real growth is invisible in the blended per-customer average because it's being swamped by a wave of connections that use nothing at all. See Section 3.

Within each rate class, does the number of customers gaining vs. losing consumption align with the direction of net load change, or is the result being driven by a small number of accounts with disproportionately large swings?

A small number of accounts. See Section 5b — RT50's losses trace to four hotels and one cement account; RT70's entire swing is one account.

Which industries are growing or declining, and why? Are changes widespread or concentrated in a few customers/classes?

Concentrated. Hotels alone outweighs the next three declining industries combined. See Section 5.

Within industries, how is the composition of demand changing? Does a higher share reflect growth or declines elsewhere?

Mixed, and worth distinguishing case by case: Cement Manufacturing's rising share is real growth (volume and share both up together); Hotels' falling share is a genuine decline, not dilution by faster-growing peers. See Section 5a.

Where is demand loss concentrated? Which Rate Class? Which consumption bucket?

By class, RT50 and RT60-ST. By consumption bucket, RT10's two lowest bands are losing customers even as everyone who remains in the higher bands uses more. By geography, the western parishes — Westmoreland, St. Elizabeth, Hanover, Trelawny and St. James — carry the whole of the residential volume decline. See Sections 3 and 4.

Is charging demand growing through more accounts or greater usage? Which operators are driving the increase?

There is an EV rate class in use, but only in the forecast layer, and only partly cut over from actuals. The Latest-Estimate table carries 26 accounts under the EV tariff (srat_code EV40) for June 2026: 52,188 kWh and J\$1.85M across 11 parishes, one or two sites per parish, every one billed to "Jamaica Public Service" or "Jamaica Public Service Co. Ltd" — this is JPS's own charging network, not third-party customers. Checking why it doesn't appear in actuals turned up the actual mechanism: 3 of the 26 accounts do have real billing history, just still coded under their old class rather than EV — one has been running J\$20–30k/month under RT40 since 2024 before going quiet after January 2025, another shows real and growing usage under RT20 through 2025 (7,153 kWh in April climbing to 12,833 by November, which reads like a charging site ramping up), and a third is a negligible ~15 kWh/month RT20 connection. The other 23 have no billing history anywhere. So this isn't "no data" — it's a forecast team that has already reclassified known EV sites onto the new tariff for planning purposes, ahead of the metering and billing side actually cutting them over. Worth asking Commercial/Metering directly when that reclassification is expected to hit the live feed.

How quickly is self-generation growing? How does it affect grid purchases, and how much activity sits outside registered net billing? For declining accounts, is the reduction due to lower usage while remaining connected versus full disconnection from the grid?

Solar shows up in two ways in the data. Customers registered on the net-billing tariff number about 890 (roughly 510 residential, 313 small business, 65 large commercial) and are barely growing, up 4–5% in a year. But customers who actually exported more than they drew in August number about 1,070 across the two residential tariffs, close to double the registered residential count, and grew 26% (RT10) and 58% (RT20) year over year — so at least 450 residential exporters sit outside registered net billing, and that group is where the growth is. The forecast expected 1,632 RT10 net-export customers in August against the 966 realized, so residential self-generation is running behind plan rather than ahead of it. Alcoa's exit was categorically different, a full one-month departure from grid draw (9 GWh to 1.2), not a gradual export pattern. Commercial exporters are rare (about 50 small-business accounts and none on RT40/RT50 in August) and commercial net-billing accounts are flat. There is no record that logs self-generation events as they happen beyond the registered tariff, so anything outside it has to be reconstructed after the fact. See Section 3 and Appendix A9.

How are demand changes affecting revenue across rate classes?

Far more gently than the volume numbers suggest — system-wide, –1.85% revenue against –5.1% volume, because the average rate rose 3.4% and absorbed most of the difference. For commercial customers there is a second cushion: demand charges are billed on peak kVA, which doesn't fall in step with kWh, so across RT40, RT50 and RT70 volume and the energy charge are both down 6.3% while the demand charge is down only 4.9%. RT70 revenue is actually up despite selling less power. See Sections 1b and 2.

Which industries now contribute the most revenue? How does an industry or rate-class change compare in scale to the overall system-level change — is it disproportionately responsible relative to its size?

Hotels lost 26.0% of its volume but only 20.1% of its revenue — a favorable rate or mix shift cushioned some of the blow. Water Supply shows the same pattern at a smaller scale. See Section 5.

What is happening within key customer businesses? Which changes are temporary disruptions versus sustained changes in grid demand?

Temporary: the hotel sector's Melissa recovery, which is closing gradually. Sustained: Alcoa's self-generation, which is a permanent reduction in grid draw, not a dip that reverses.

Is average revenue per kWh changing?

Yes, and it's the main reason revenue held up better than volume — the system-wide blended rate rose from J\$50.95/kWh to J\$52.68/kWh, +3.4%. Every rate class saw its own rate rise over the period; RT70 (+6.7%) and RT40 (+5.2%) moved the most.

Data Gaps Identified This Pass

A few things came up repeatedly enough while working through this that they're worth listing separately rather than burying in the sections above, since they'll limit how far any future version of this analysis can go until they're addressed.

- **Parish by consumption band isn't available for residential.** Every residential account carries a parish in the source billing records, and Section 4 now uses that directly. But the residential band feed into the sales platform combines all parishes into one island-wide total, so a band-by-parish cut still needs that feed rebuilt at parish level.

- **Registered net billing isn't flagged in the sales platform.** The net-billing tariff (about 890 accounts) is folded into the ordinary residential, small-business and commercial classes on the way in, so it can only be seen by going back to the billing extract, which is where the figures in this report come from. Customers exporting in the month can be seen in the platform, but that is a different and larger group (Section 3, Appendix A9). Carrying a net-billing flag through to the platform would remove the need to reconstruct it.
- **Revenue components are stored only for commercial accounts.** Fuel, energy, IPP and customer-charge splits are held in the platform for commercial accounts only. Residential components in Section 1b come straight from the billing extract, and prepaid isn't split by component in any source, so it appears as a single revenue line.
- **GCT is missing for the larger commercial classes in recent months.** Tax on RT40, RT50, RT60-ST and RT70 hasn't been loaded for May, July or August 2026 (and RT60-ST in June looks out of line with earlier months), so tax is shown for January to April only.
- **"Other" revenue fell J\$1.2 billion year over year.** Adjustments and credits dropped from about J\$200 million a month on commercial accounts in early 2025 to about J\$55 million in 2026. It accounts for over half of the net revenue decline and should be confirmed with Billing as either real or a change in how adjustments are recorded.
- **EV charging (tariff EV40) is modeled in the forecast layer ahead of the actuals cutover.** 26 JPS-owned sites are already classified as EV in the June-2026 Latest Estimate; 3 have real billing history, still coded under RT40/RT20. There's no way to track EV growth, public or JPS-owned, until the metering/billing side finishes reclassifying these accounts into the live feed.
- **Fixed during this pass, not just flagged.** Every commercial account on RT20, RT40, RT50, RT60-ST and RT70 was being given the same generic "Commercial" usage tag regardless of what it actually consumed — so a business exporting power to the grid, or one billing zero for the month, looked identical in the data to one drawing normal load. That's why export and zero-consumption commercial customers were invisible to the cuts used elsewhere in this report. Corrected across the full history. Real counts, now visible: RT40 carries 71 net-exporting customer-months and 1,287 zero-consumption customer-months historically; RT50 carries 65 and 166; RT20 commercial carries 783 and 47,614 out of 461,828 records. Commercial customers exporting in the month are rare and not trending sharply (RT40 about 1 a month in 2025 to about 2.75 in 2026, RT50 flat at about 2).
- **Self-generation is only tracked through the net-billing tariff.** The planning record that looks like it should log self-generation is forward-looking assumptions for 2027 onward. Anything outside the roughly 890 registered accounts — including a large single-account change like Alcoa's — has to be reconstructed after the fact from billing going to zero or negative.
- **About one kWh in eight of commercial volume carries no industry classification** (12.6% in 2026), almost all of it small-business accounts, where 56% of volume is untagged. A tagging cleanup targeted at the small-business file would close nearly all of it (Section 5).

Appendix

Supporting tables for the sections above. Unless stated, figures are August 2025 against August 2026, or January to August for year-to-date measures. Sales are billed kWh; revenue is net billed revenue before GCT.

A1. Reconciliation of the segment view to the system totals

Customers	Aug 2025	Aug 2026
Residential — billed monthly	684,552	694,028
Prepaid	16,574	18,488
Commercial	26,134	26,066
Combined	727,260	738,582
Less: individually metered small-business accounts, not in the earlier headcount	-23,617	-23,542
Equals the previously reported system total	703,643	715,040

Sales and revenue	Segments added up	Previously reported	Difference
Sales Aug 2025 (GWh)	307.00	307.00	0.00
Sales Aug 2026 (GWh)	303.96	303.96	0.00
Sales Jan–Aug 2025 (GWh)	2,248.2	2,248.2	0.0
Sales Jan–Aug 2026 (GWh)	2,134.2	2,134.2	0.0
Revenue Jan–Aug 2025 (J\$M)	114,545	114,545	0
Revenue Jan–Aug 2026 (J\$M)	112,431	112,431	0

Differences are rounding only. The revenue components in Section 1b also add back to these revenue totals to within J\$1M.

A2. Consumption bands — RT10 residential

Band (kWh per month)	Customers Aug-25	Customers Aug-26	Change	GWh Aug-25	GWh Aug-26
Net export (below zero)	768	966	+198 (+25.8%)	-0.15	-0.25
Zero consumption	50,569	57,968	+7,399 (+14.6%)	0.00	0.00
Under 150	312,030	310,802	-1,228 (-0.4%)	23.88	23.22
150 to 350	206,685	201,151	-5,534 (-2.7%)	46.08	45.07
350 to 550	40,652	44,120	+3,468 (+8.5%)	17.39	18.94
550 to 750	12,672	14,436	+1,764 (+13.9%)	8.03	9.15
750 to 950	5,092	6,129	+1,037 (+20.4%)	4.26	5.13
Over 950	6,854	8,155	+1,301 (+19.0%)	11.40	13.30
Prepaid	16,080	17,983	+1,903 (+11.8%)	2.57	3.10
Total	651,402	661,710	+10,308 (+1.6%)	113.46	117.66

A3. Consumption bands — RT20 residential (small residential-type accounts)

Band (kWh per month)	Customers Aug-25	Customers Aug-26	Change	GWh Aug-25	GWh Aug-26
Net export (below zero)	67	106	+39 (+58.2%)	-0.09	-0.05
Zero consumption	5,712	6,340	+628 (+11.0%)	0.00	0.00
Under 150	18,927	18,874	-53 (-0.3%)	1.12	1.10
150 to 350	10,085	9,992	-93 (-0.9%)	2.37	2.36
350 to 550	4,788	4,757	-31 (-0.6%)	2.10	2.09
550 to 750	2,537	2,658	+121 (+4.8%)	1.63	1.71
750 to 950	1,615	1,671	+56 (+3.5%)	1.36	1.41
Over 950	5,499	5,903	+404 (+7.3%)	12.86	15.07
Prepaid	494	505	+11 (+2.2%)	0.11	0.12
Total	49,724	50,806	+1,082 (+2.2%)	21.46	23.81

RT10 and RT20 residential use the standard residential bands. Customers in the prepaid line are also counted in the totals but have no band; net export means the customer sent more solar to the grid than it drew that month.

A4. Consumption bands — RT20 commercial (small business, individually metered)

Band (kWh per month)	Customers Aug-25	Customers Aug-26	Change	GWh Aug-25	GWh Aug-26
Net export (below zero)	25	50	+25 (+100.0%)	-0.02	-0.04
Zero consumption	1,892	2,112	+220 (+11.6%)	0.00	0.00
1 to 1,000	14,412	14,122	-290 (-2.0%)	3.89	3.82
1,001 to 5,000	5,581	5,559	-22 (-0.4%)	12.49	12.49
5,001 to 20,000	1,512	1,502	-10 (-0.7%)	13.61	13.46
20,001 to 100,000	191	194	+3 (+1.6%)	6.75	6.72
100,001 to 500,000	4	3	-1 (-25.0%)	0.53	0.36
Total	23,617	23,542	-75 (-0.3%)	37.25	36.80

A5. Consumption bands — RT40 Commercial

Band (kWh per month)	Customers Aug-25	Customers Aug-26	Change	GWh Aug-25	GWh Aug-26
Zero consumption	26	31	+5 (+19.2%)	0.00	0.00
1 to 1,000	78	95	+17 (+21.8%)	0.03	0.03
1,001 to 5,000	218	198	-20 (-9.2%)	0.67	0.59
5,001 to 20,000	737	749	+12 (+1.6%)	8.49	8.60
20,001 to 100,000	736	738	+2 (+0.3%)	32.65	32.75
100,001 to 500,000	147	140	-7 (-4.8%)	25.29	24.12
Over 500,000	5	5	0 (0.0%)	4.31	5.79
Total	1,947	1,956	+9 (+0.5%)	71.44	71.88

A6. Consumption bands — RT50 Large Commercial

Band (kWh per month)	Customers Aug-25	Customers Aug-26	Change	GWh Aug-25	GWh Aug-26
Net export (below zero)	1	0	-1 (-100.0%)	0.00	0.00
Zero consumption	5	10	+5 (+100.0%)	0.00	0.00
1 to 1,000	4	1	-3 (-75.0%)	0.00	0.00
1,001 to 5,000	7	10	+3 (+42.9%)	0.02	0.03
5,001 to 20,000	16	18	+2 (+12.5%)	0.18	0.23
20,001 to 100,000	59	55	-4 (-6.8%)	2.87	2.70
100,001 to 500,000	54	55	+1 (+1.9%)	12.42	12.66
Over 500,000	12	10	-2 (-16.7%)	16.98	15.06
Total	158	159	+1 (+0.6%)	32.48	30.68

A7. Consumption bands — RT60-ST Street Lighting

Band (kWh per month)	Customers Aug-25	Customers Aug-26	Change	GWh Aug-25	GWh Aug-26
1 to 1,000	364	364	0 (0.0%)	0.04	0.04
1,001 to 5,000	11	11	0 (0.0%)	0.02	0.01
20,001 to 100,000	1	1	0 (0.0%)	0.09	0.09
100,001 to 500,000	10	10	0 (0.0%)	1.76	1.77
Over 500,000	2	2	0 (0.0%)	1.50	1.50
Total	388	388	0 (0.0%)	3.40	3.41

A8. Consumption bands — RT70 Industrial

Band (kWh per month)	Customers Aug-25	Customers Aug-26	Change	GWh Aug-25	GWh Aug-26
Zero consumption	2	0	-2 (-100.0%)	0.00	0.00
1 to 1,000	1	1	0 (0.0%)	0.00	0.00
1,001 to 5,000	1	0	-1 (-100.0%)	0.00	0.00
5,001 to 20,000	1	1	0 (0.0%)	0.01	0.01
100,001 to 500,000	1	4	+3 (+300.0%)	0.32	1.58
Over 500,000	18	15	-3 (-16.7%)	27.18	18.12
Total	24	21	-3 (-12.5%)	27.52	19.71

Commercial and industrial classes are individually metered, so the bands are set on each account's monthly kWh rather than the residential bands. Thirteen zero-consumption accounts (eleven a year ago) are not mapped to any rate class and are left out of the class tables; the volume involved is nil.

A9. Net billing — registered customers against customers exporting in the month

Registered on the net-billing tariff	Aug 2025	Dec 2025	Aug 2026	Change
Residential (NB10)	486	488	511	+25 (+5.1%)
Small business (NB20)	301	302	313	+12 (+4.0%)
Large commercial (NB40)	66	64	65	-1 (-1.5%)
Total registered	853	854	889	+36 (+4.2%)

Customers exporting more than they drew, in August	Aug 2025	Aug 2026	Change
RT10 residential	768	966	+198 (+25.8%)
RT20 residential	67	106	+39 (+58.2%)
RT20 commercial	25	50	+25 (+100.0%)
RT40 and RT50 commercial	1	0	

Registered net-billing customers, on average, still draw more from the grid than they export, so they are not the same population as customers in net export in a given month. Registered figures come from the billing extract; the sales platform does not currently flag the net-billing tariff.

A10. Demand-billed classes — volume, billed demand and charges, January to August

Class	GWh	Billed kVA (thousands)	Energy charge (J\$M)	Demand charge (J\$M)
RT40 Commercial	536.4 → 502.5	2,066 → 1,980	3,620 → 3,391	5,206 → 5,007
RT50 Large Commercial	253.6 → 229.3	1,369 → 1,284	1,228 → 1,113	1,760 → 1,628
RT70 Industrial	199.6 → 195.2	936 → 851	994 → 972	1,809 → 1,709

Billed kVA is the sum of the monthly billed demand across the accounts in each class.

A11. Definitions

- **Residential — billed monthly:** RT10 homeowner accounts and the residential-type accounts on RT20, billed after use. **Prepaid:** pay-as-you-go accounts on RT10 and RT20, reported separately. **Commercial:** RT20 accounts registered as businesses, plus RT40, RT50, RT60-ST and RT70.
- **Customers** are billed accounts in the month: residential counts come as totals by band, commercial counts are one per metered account. **Sales** are billed kWh. **Revenue** is net billed revenue before GCT, which is shown separately.
- **Non-fuel charges** are the customer charge, energy charge and (commercial only) demand charge; **fuel** and **IPP** are the pass-through charges; **other** is what remains between the sum of those charges and net revenue (billing adjustments and credits).
