

Sales Analysis — September 2026

Sales Forecasting & Analysis · YTD January–September 2026 vs 2025 · October 2026

September at a glance

- **Sales 294.7 GWh, down 2.3% on last year (1.8% after correcting a billing-timing distortion); revenue up 0.8%** because the average rate rose 3.2%. Year to date, sales are down 4.7% and revenue down 1.5%.
- **The split widened.** Residential volume grew 5.0% and prepaid 15%, while commercial fell 8.1%.
- **Alcoa is the single biggest swing:** 0.8 GWh against 7.1 a year ago, 45% of the commercial decline. Its August and September demand charges are provisional and will be adjusted down, so commercial revenue for those months is overstated by up to about J\$175 million.
- **Billing timing at Caribbean Broilers** distorts the month: a double bill in August and only a stub in September move about 1.6 GWh between the two.
- **Caribbean Cement dipped** (9.1 GWh against 10.8 a year ago) after a strong year, while **hotels are recovering**, down 19% in September against 25% year to date.
- **Inactive connections keep growing:** RT10 added 1,071 zero-consumption accounts in September, more than its net growth of 802, so active residential customers fell slightly.
- **Solar is accelerating outside the registered scheme:** 1,026 RT10 customers exported more than they drew (up 124% year over year) against 518 registered net billers.
- **Demand holds up better than energy:** excluding Alcoa, year-to-date billed kVA is down 4.3% against kWh down 6.4%.

Sales by Segment

Sales are shown for four groups, because customers and sales behave very differently across the base: residential customers billed monthly, prepaid customers, commercial customers, and the combined system view.

Residential — billed monthly (homes and small residential-type accounts)

Metric	Sep 2025	Sep 2026	Change
Customers	684,820	695,004	+10,184 (+1.49%)
Sales (GWh, month)	128.50	134.96	+6.46 (+5.03%)
Sales YTD (GWh, Jan–Sep)	1,080.9	1,038.1	-42.8 (-3.96%)
Revenue YTD (J\$M)	62,369	61,267	-1,102 (-1.77%)

This is where nearly all the customer growth in the system-wide numbers actually comes from, and it's also where the "growth" is least real. Of the 9,900 net new homeowner-tariff accounts over the year, 8,104 — 82 cents of every new dollar of "growth" — are premises that are connected and billing exactly zero. The small-business tariff shows the same thing at a smaller scale, 44% of its growth. The most plausible read, given the timing, is Hurricane Melissa: homes and small businesses that were damaged or vacated in November 2025 and are still on the books but haven't been reactivated. That's an inference from the timing, not something confirmed directly in the billing data, but it's the only explanation that's consistent with everything else this analysis turned up. Volume tells a more encouraging in-month story than the year-to-date figure suggests — September itself is up 5.0% year over year, and customers are migrating into *higher* consumption bands over this period, not lower. The year-to-date shortfall is concentrated in the western parishes that took the storm —

Westmoreland down 27.7% in volume, St. Elizabeth 19.4%, Hanover 12.4%, Trelawny 10.5%, St. James 9.7% — while the rest of the island is flat to slightly up (Section 4). That is a recovery-lag pattern, not a fading trend.

Prepaid (pay-as-you-go)

Metric	Sep 2025	Sep 2026	Change
Customers	16,930	18,415	+1,485 (+8.77%)
Sales (GWh, month)	2.61	3.01	+0.39 (+15.11%)
Sales YTD (GWh, Jan–Sep)	21.2	23.1	+1.9 (+9.04%)
Revenue YTD (J\$M)	1,180	1,367	+187 (+15.84%)

Prepaid is the only residential segment growing on every measure, and it's growing much faster than the rest of the residential base: customers up 8.8% against 1.5% for monthly-billed residential, volume up 9.0% year to date and 15.1% in September alone, revenue up 15.8%. It is still small — about 2.5% of customers, 1% of volume and 1% of revenue. Looking account by account, growth is slowing (active accounts were up 18.5% in the year to September 2025 and are up 8.8% now), but the customers who stay are using more: the same 13,870 accounts used 7.0% more than a year ago, and average monthly spend per account is J\$10,092, up 8.8%, with the share spending J\$20,000 or more rising from 9% to 11%. The price paid, including tax, is J\$61.8 per kWh, up 2.7%. Turnover is high: about 12% of accounts drop out and about 11% join each month, and new accounts use far less (about 93 kWh a month against 172 for retained ones). About one in five prepaid accounts (4,086) has no tariff assigned, up from 912 two years ago. Average use per account eased in September (174 to 163 kWh), more than the shorter month explains. The pattern is consistent with households moving to prepaid for budget control, though the billing data can't confirm the reason for the switch.

Commercial (registered businesses, individually metered)

Metric	Sep 2025	Sep 2026	Change
Customers	26,762	26,011	-751 (-2.81%)
Sales (GWh, month)	170.60	156.72	-13.88 (-8.14%)
Sales YTD (GWh, Jan–Sep)	1,447.9	1,367.7	-80.2 (-5.54%)
Revenue YTD (J\$M)	66,276	65,205	-1,071 (-1.62%)

The opposite pattern from residential: the connection count is down 2.8%, almost all of it small-business accounts, and the volume decline is real, not a labeling artifact — but it traces to a few specific, nameable events, not a diffuse trend. Alcoa Minerals' self-generation came fully online in August: it billed 0.8 GWh in September against 7.1 a year ago, which alone is 6.2 GWh of the month's 13.9 GWh commercial decline, and that grid draw isn't coming back. Separately, the hotel sector still hasn't finished recovering from Melissa — it is improving, just not there yet. Caribbean Cement was a notable reversal in September: 9.1 GWh against 10.8 a year ago, even though it remains well ahead year to date. Month-on-month figures are also distorted by billing timing at Caribbean Broilers: its main plant was billed for two periods in August (3.4 GWh against a normal 1.7) and only a stub in September (0.08 GWh), so August is overstated and September understated by roughly 1.6 GWh each; normalised, September commercial sales are about 7% below last year, or about 4% below excluding Alcoa. Commercial revenue held up far better than commercial volume (down 1.6% against 5.5%) because demand charges are billed on peak kVA rather than kWh — see Section 1b. One caution on the revenue side: Alcoa's August and September demand charges (J\$88 million and J\$86 million, against about J\$60 million a month earlier in the year) are provisional and due to be adjusted down, so commercial revenue

for those two months is likely overstated by up to about J\$175 million, or 0.3% of year-to-date commercial revenue.

Combined (system-wide)

Metric	Sep 2025	Sep 2026	Change
Customers	728,512	739,430	+10,918 (+1.50%)
Sales (GWh, month)	301.71	294.69	-7.02 (-2.3%)
Sales YTD (GWh, Jan–Sep)	2,550.0	2,428.9	-121.0 (-4.7%)
Revenue YTD (J\$M)	129,824	127,839	-1,986 (-1.53%)

The three segments above add exactly to these combined figures (Appendix, Table A1). Customer counts include the individually metered small-business accounts, which are close to flat year over year. September 2026 commercial and combined sales are understated by about 1.6 GWh of billing timing at Caribbean Broilers; adjusted, September combined sales are about 296.3 GWh, down 1.8% on last year.

Reading across the segments

Nearly all of the customer growth is residential, and most of it is inactive connections still on the books after Melissa rather than new load. Nearly all of the volume decline is commercial — a few large accounts and the hotel sector — plus a residential shortfall that sits in the storm-hit western parishes. Prepaid is the one segment growing on every measure but is still too small to move the total. There is no sign of broad conservation or self-generation: residential volume is up in the month and migrating into higher consumption bands, and commercial volume outside Alcoa and the hotel sector is close to flat.

1. Top Level

Overall, sales are down 4.7% year to date and customers are up 1.5%. Revenue held up much better than volume — down only 1.53% — because the average rate paid per kWh rose 3.4% across the period and absorbed most of the volume shortfall. September itself was close to the year's best against the prior year: sales were down 2.3% (1.8% after adjusting for billing timing at Caribbean Broilers) and revenue up 0.8%. It's worth remembering that the 2025 base itself isn't a clean baseline: it was already running below normal from November onward because of the storm, so part of this year's "decline" is really "hasn't caught back up yet" rather than fresh deterioration on top of a healthy prior year.

1b. Revenue composition — what is actually moving

Revenue is billed in layers that behave very differently: the non-fuel charges (customer charge, energy charge and, for commercial customers, the demand charge on peak kVA) are the part JPS keeps to run the network; fuel and IPP purchased power are largely passed through; taxes (GCT) are billed on top and shown below net revenue.

Combined

J\$M, Jan–Sep	2025	2026	Change	Share of net revenue, 2026
Non-fuel charges (customer + energy + demand)	40,884	39,464	–1,420 (–3.5%)	30.9%
Fuel	60,568	64,516	+3,948 (+6.5%)	50.5%
IPP (purchased power)	25,053	21,714	–3,339 (–13.3%)	17.0%
Other (billing adjustments, credits)	2,140	778	–1,362 (–63.6%)	0.6%
Prepaid (single line)	1,180	1,367	+187 (+15.8%)	1.1%
Net revenue (before GCT)	129,824	127,839	–1,986 (–1.53%)	100.0%
Taxes (GCT)	10,846	10,640	–206 (–1.9%)	
Total billed, including GCT	140,670	138,479	–2,191 (–1.56%)	

Three movements explain the net J\$2.0 billion decline in net revenue. IPP is down J\$3.3 billion (–13.3%) and non-fuel charges are down J\$1.4 billion (–3.5%), against a J\$3.9 billion increase in fuel (+6.5%) that cushions them. Fuel and IPP move in opposite directions but together they are up just 0.7% on 5% less volume, so read the pair as one pass-through block; the individual lines swing from month to month. The line to watch is "Other", which fell from J\$2.1 billion to J\$0.8 billion and on its own accounts for about 69% of the net decline — it is a residual of billing adjustments and credits rather than a charge, and a drop of that size in a single year is worth confirming with Billing before it's treated as either real or permanent.

Residential — billed monthly

J\$M, Jan–Sep	2025	2026	Change	Share of net revenue, 2026
Non-fuel charges (customer + energy + demand)	20,518	19,991	–527 (–2.6%)	32.6%
<i>Customer charge</i>	4,031	4,066	+35 (+0.9%)	6.6%
<i>Energy charge</i>	16,487	15,925	–562 (–3.4%)	26.0%
Fuel	27,270	28,910	+1,640 (+6.0%)	47.2%
IPP (purchased power)	14,145	12,114	–2,031 (–14.4%)	19.8%
Other (billing adjustments, credits)	435	251	–184 (–42.2%)	0.4%
Net revenue (before GCT)	62,369	61,267	–1,102 (–1.77%)	100.0%
Taxes (GCT)	1,635	1,541	–94 (–5.8%)	
Total billed, including GCT	64,004	62,808	–1,196 (–1.87%)	

Commercial

J\$M, Jan–Sep	2025	2026	Change	Share of net revenue, 2026
Non-fuel charges (customer + energy + demand)	20,365	19,472	–893 (–4.4%)	29.9%
<i>Customer charge</i>	442	462	+20 (+4.5%)	0.7%
<i>Energy charge</i>	10,071	9,587	–484 (–4.8%)	14.7%
<i>Demand (kVA) charge</i>	9,852	9,423	–429 (–4.4%)	14.5%
Fuel	33,298	35,606	+2,308 (+6.9%)	54.6%
IPP (purchased power)	10,908	9,600	–1,308 (–12.0%)	14.7%
Other (billing adjustments, credits)	1,705	527	–1,178 (–69.1%)	0.8%
Net revenue (before GCT)	66,276	65,205	–1,071 (–1.62%)	100.0%
Taxes (GCT)	9,123	8,998	–125 (–1.4%)	
Total billed, including GCT	75,399	74,204	–1,195 (–1.59%)	

Commercial non-fuel charges fell 4.4% against a 5.5% fall in volume, and the reason is in the demand line. Demand charges are billed on peak kVA, not on kWh, and a customer's peak doesn't fall in proportion to its total consumption: a plant that runs less often still hits the same peak when it does run. The demand analysis below excludes Alcoa: its self-generation exit dominates RT70, and its billed demand for August and September is provisional and will be adjusted down, so it would otherwise distort the picture. Across the three demand-billed classes without Alcoa, volume is down 6.4% year to date and the energy charge is down 6.1% right alongside it, but the demand charge is down only 4.1% and billed kVA only 4.3%. That gap is why commercial revenue (–1.6%) is so much more resilient than commercial volume (–5.5%).

Demand-billed classes excluding Alcoa, Jan–Sep	kWh	Billed kVA	Energy charge	Demand charge
RT40 Commercial	–6.1%	–3.9%	–5.9%	–3.6%
RT50 Large Commercial	–9.6%	–6.6%	–9.4%	–7.3%
RT70 Industrial (excluding Alcoa)	–1.9%	–0.5%	–1.9%	–1.7%
All three	–6.4%	–4.3%	–6.1%	–4.1%

The clearest example is RT70 without Alcoa in September, where volume fell 11.5% yet billed kVA was unchanged at 83.0k. Fifteen large accounts cut their kWh by 25% or more year over year in September while keeping billed demand within 10% — among them Playa Hall (kWh down 65%, demand unchanged), Petrojam (down 47% against demand down 8%) and Windalco — so customers are holding capacity while they use less energy. The data alone can't say whether that is contract minimums or a deliberate hold on capacity for the recovery.

Average revenue per kWh

The same layers expressed per kWh sold, which strips out the volume decline and shows what each unit of sales is actually earning. Residential and commercial use their own volumes; the combined column spreads everything, including prepaid revenue, over total system volume.

J\$ per kWh, Jan–Sep	Resid. 2025	Resid. 2026	Comm. 2025	Comm. 2026	Comb. 2025	Comb. 2026	Comb. Δ
Non-fuel charges	18.98	19.26	14.07	14.24	16.03	16.25	+1.3%
Fuel	25.23	27.85	23.00	26.03	23.75	26.56	+11.8%
IPP (purchased power)	13.09	11.67	7.53	7.02	9.82	8.94	−9.0%
Other	0.40	0.24	1.18	0.39	0.84	0.32	−61.8%
Prepaid (single line)	—	—	—	—	0.46	0.56	+21.6%
Net revenue per kWh	57.70	59.02	45.77	47.67	50.91	52.63	+3.4%
Taxes (GCT)	1.51	1.48	6.30	6.58	4.25	4.38	+3.0%
Billed per kWh, including GCT	59.22	60.50	52.08	54.25	55.17	57.01	+3.3%

The average net rate rose from J\$50.91 to J\$52.63 per kWh (+3.4%). Fuel more than explains the increase (+J\$2.81 per kWh), offset by lower IPP (−J\$0.89) and smaller billing adjustments (−J\$0.52). The non-fuel layer, the part that pays for the network, is roughly flat at about J\$16.2 per kWh (+1.3%), so the network-charge yield per unit sold has held up even as volume fell. Residential customers pay more per kWh than commercial in every layer of net revenue (J\$59.02 against J\$47.67 in 2026); commercial tax per kWh is far higher (J\$6.58 against J\$1.48) because GCT is billed on almost all commercial consumption and on only part of residential.

Taxes (GCT)

GCT billed, Jan–Sep (J\$M)	2025	2026	Change	Effective rate 2026
Residential — billed monthly	1,635	1,541	−94 (−5.8%)	2.5%
Prepaid	87	100	+14 (+15.7%)	7.3%
Commercial	9,123	8,998	−125 (−1.4%)	13.8%
Total	10,846	10,640	−206 (−1.9%)	8.3%

Total tax billed fell 1.9% against a 1.5% fall in net revenue. Commercial tax tracks commercial revenue almost one for one at about 13.8%; the difference comes from residential, where tax fell 5.8% against a 1.8% fall in revenue. That fits residential tax applying mostly to higher-consumption bills, which have fallen furthest in the storm-hit parishes. Prepaid tax for June is estimated at the neighbouring months' effective rate.

2. Across Rate Class

Class	GWh Δ	Customers Δ	kWh/cust Δ	Revenue Δ	J\$/kWh Δ
RT10 Residential	-3.0%	+1.5%	-4.4%	-0.4%	+2.6%
RT20 Small Commercial	-3.0%	+1.4%	-4.3%	-2.0%	+1.1%
RT40 Commercial	-5.9%	+0.9%	-6.7%	-1.3%	+4.9%
RT50 Large Commercial	-9.6%	-0.6%	-9.0%	-7.4%	+2.5%
RT60-ST Street Lighting	-9.5%	0.0%	-9.5%	-8.8%	+0.8%
RT70 Industrial	-5.7%	-8.7% (2 accts)	+3.3%	+1.6%	+7.8%

Every class lost volume and every class gained rate — that part is uniform. RT70 is the one that looks odd at first glance, revenue actually up despite less electricity sold, but it's mechanical rather than encouraging: Alcoa's volume, one of the largest and presumably one of the cheaper-rate loads on the system, has fallen away and the class has lost two accounts, which pulls the average rate of everyone who's left upward. Alcoa's provisional demand charges also flatter RT70 revenue until they are adjusted down. It's a mix effect, not industrial customers suddenly paying more for the same power. One reclassification also flatters RT70 and penalises RT50: a hotel (Falmouth PHR) moved from RT50 to RT70 in August 2025, so about 6 GWh of RT50's decline is a change of class, not lost load. Treating that hotel consistently in both years, RT50 is down 7.6% and RT70 is down 8.4%.

3. Within Rate Class — Consumption Blocks

RT10 and RT20 are the only two classes with banded consumption data, and both tell the same story: the Under-150 and 150–350 kWh bands are shrinking while the bands above 350 kWh are growing. Concretely, for RT10 the two lowest bands lost 8,191 customers combined while the four bands from 350 kWh up gained 7,934 — more customers moved up than moved out of the low end, which means the migration is being topped up by some new connections landing directly in the middle bands too, not just by existing low-usage customers climbing. Either way, the direction is up, not down. The band tables for every rate class are in the Appendix (Tables A2–A8).

	RT10	RT20 (residential)
Zero-consumption customers, Sep-25 → Sep-26	50,935 → 59,039 (+8,104, +15.9%)	5,704 → 6,480 (+776, +13.6%)
Share of that class's total customer growth	82%	44%
Registered net-billing customers, Sep-25 → Sep-26	484 → 518 (+34, +7.0%)	301 → 312 (+11, +3.7%)
Customers exporting more than they draw in the month, Sep-25 → Sep-26	459 → 1026 (+567, +123.5%)	60 → 119 (+59, +98.3%)

So the falling per-customer average isn't existing customers pulling back — it's the blended average getting diluted by a large number of connections that aren't consuming anything at all. That's a meaningfully different problem to solve than "customers are conserving," and it points toward a data-cleanup and reconnection question (are these premises actually vacant, or just stuck in a billing/meter-read backlog?) rather than a demand-forecasting one. Zero-consumption connections are still rising ten months after the storm: RT10 added 1,071 in September alone, more than its entire net customer growth for the month, so active residential customers actually fell slightly.

Solar shows up in two different ways in the data, and they tell different stories. Customers registered on the net-billing tariff are few and growing slowly — 518 on the residential tariff (+7.0%) and 312 on the small-business tariff (+3.7%), with another 65 large commercial accounts that haven't moved — 895 in all, up 5.3%. They are not small users: registered residential net billers still draw about 710 kWh a month on average, four times the residential average, and the export credits they earn have been steady at about J\$10 million a month across all three tariffs. But the number of customers who actually exported more than they drew in September is close to double the registered residential count (1,026 against 518) and more than doubled year over year (+124%); the volume they exported rose even faster, from 103 MWh to 259 MWh. At least 508 residential exporters are therefore not on the registered scheme, or not yet — activity that sits outside registered net billing. The pattern is also seasonal: exporters peak in the low-consumption winter months and trough in summer. Like for like, the summer months of 2026 (June to September, about 1,060 a month) are 62% above summer 2025, but the winter peak was lower, with 1,448 exporters in January and February 2026 against 2,006 a year earlier. A drop in the peak while the base rises is consistent with some rooftop systems having been damaged in the storm, though the billing data can't confirm that. It is still small in absolute terms — about 1,145 customers across the two residential tariffs — but the direction is clear and the registered count understates it. One caution: a single month of net export can also come from a meter correction or a billing estimate reversal, so the export count is an upper bound on solar, not a precise measure.

4. By Parish

Every residential account carries a parish, so the residential base is shown here alongside commercial. Consumption bands (Section 3 and Appendix A2) are island-wide.

Residential (billed monthly), by parish — sorted from steepest volume decline

Parish	Customers, Sep-26	Customers Δ	GWh, Jan–Sep 26	GWh Δ	Revenue Δ
Westmoreland	33,161	+1.5%	29.4	−27.7%	−26.2%
St. Elizabeth	43,874	+1.7%	37.5	−19.4%	−17.7%
Hanover	15,924	+0.7%	18.5	−12.4%	−10.1%
Trelawny	19,940	+2.1%	21.9	−10.5%	−8.0%
St. James	58,530	+0.9%	78.5	−9.7%	−7.5%
St. Ann	47,912	+2.1%	58.2	−4.4%	−1.8%
Manchester	45,517	+1.6%	47.6	−1.7%	+1.0%
St. Mary	31,555	+1.1%	37.4	0.0%	+2.7%
Clarendon	48,277	+1.5%	52.3	+0.6%	+3.3%
Portmore	51,697	+1.7%	81.2	+0.6%	+3.1%
St. Catherine	80,317	+1.5%	105.5	+1.3%	+3.8%
KSAS	44,651	+0.5%	71.5	+1.9%	+4.8%
Portland	22,862	+1.3%	25.7	+2.0%	+4.8%
KSAN	80,150	+1.0%	173.1	+2.1%	+4.6%
St. Thomas	20,162	+0.3%	21.9	+3.6%	+6.3%
Total	644,529	+1.3%	860.3	−3.3%	−0.8%

Customer growth is even across the island, between 0.3% and 2.1% everywhere, but volume is not. The five steepest declines — Westmoreland, St. Elizabeth, Hanover, Trelawny and St. James — are the western parishes hit hardest by Hurricane Melissa, and together they account for more than the whole of the residential volume shortfall; the rest of the island runs from -4.4% (St. Ann) to +3.6% (St. Thomas), mostly within $\pm 2\%$. It's the same geography as the hotel story in Section 5, showing up on the residential side: connections are back or holding, consumption in the storm-hit areas isn't yet.

Commercial accounts (RT20 commercial, RT40, RT50, RT60-ST, RT70) show the same western pattern — St. James down 23.8% in GWh, St. Elizabeth down 20.6%, Westmoreland down 14.5%.

5. By Sector / Industry

This covers the commercial classes (small-business commercial RT20, RT40, RT50 and RT70). RT10 residential and RT60-ST street lighting carry no industry classification, so they are excluded here by definition, not by choice. Figures are January to September.

Top 10 industries by 2026 volume

Industry	GWh 2025	GWh 2026	GWh Δ	Share of commercial GWh, 2026	Revenue Δ
1. Water Supply and Irrigation Systems	173.8	158.0	-9.1%	11.8%	-4.0%
2. Hotels (except Casino Hotels) and Motels	194.6	145.5	-25.2%	10.9%	-19.7%
3. Cement Manufacturing	71.1	82.5	+16.1%	6.2%	+16.1%
4. Other Metal Ore Mining	85.2	80.8	-5.2%	6.0%	+1.2%
5. Wired and Wireless Telecommunications Carriers	64.4	61.0	-5.3%	4.5%	-2.6%
6. Executive Offices	48.5	47.1	-2.9%	3.5%	-0.5%
7. Full-Service Restaurants	42.8	42.4	-1.1%	3.2%	+2.4%
8. Banking, Insurance and Investments	39.8	38.5	-3.1%	2.9%	-0.1%
9. Food Manufacturing	33.0	34.3	+3.9%	2.6%	+7.5%
10. Supermarkets and Other Grocery Retailers	33.2	33.7	+1.4%	2.5%	+6.0%
All other industries with an industry assigned	466.1	445.7	-4.4%	33.3%	+0.0%
<i>Industry not yet assigned</i>	165.0	170.9	+3.5%	12.7%	+5.2%
Total commercial	1,417.5	1,340.2	-5.5%	100.0%	-1.4%

The top ten industries make up 54% of commercial volume, another 33% is spread across the remaining industries with an industry assigned, and about 13% belongs to real businesses whose industry hasn't been assigned yet. Residential accounts are excluded because they can't carry an industry; on the commercial accounts that should, the gap is 12.7% of volume in 2026 (11.6% in 2025). It is also not evenly spread: it sits almost entirely in small-business commercial accounts, where 56% of volume (166 of 297 GWh) has no industry assigned, against about 1% for RT40, RT50 and RT70. These are identifiable businesses (a coffee chain, printers, an auto dealer, quarries, government departments), so the gap is a classification backlog, not missing customers. By premise count that is roughly 17,900 accounts. Assigning industries to the small-business accounts would close nearly all of it.

Biggest movers

Industry	GWh Δ	Revenue Δ
Hotels (except Casino Hotels) and Motels	-25.2%	-19.7%
Poultry Hatcheries	-25.5%	-23.2%
Telemarketing / Contact Centers	-21.7%	-17.8%
Water Supply and Irrigation Systems	-9.1%	-4.0%
Cement Manufacturing	+16.1%	+16.1%
Distilleries	+15.0%	+15.9%
Other Metal Ore Mining	-5.2%	+1.2%

Hotels is, by a wide margin, the single largest identifiable industry drag on the system — 49.1 GWh lost, more than the next three declining industries combined (34.0 GWh). Other Metal Ore Mining has turned negative as Alcoa's exit works through the year-to-date total, and Cement Manufacturing's growth has slowed from its earlier pace but is still the largest gain. Everything else with an industry assigned mostly moves within about $\pm 5\%$, so this reads as concentrated in a few sectors rather than a broad commercial slowdown.

5a. Composition — is a rising share growth, or everyone else declining?

A rising share can mean real growth, or simply other industries falling faster around it. The table separates the two.

Industry	Share of commercial GWh, 2025	Share, 2026	Read
Hotels	13.73%	10.86%	Share falling — genuine decline, not dilution
Cement Manufacturing	5.02%	6.16%	Share rising , volume also up 16.1% — real growth
Other Metal Ore Mining	6.01%	6.03%	Share holding, but volume is down 5.2% — Alcoa's exit offset by gains at Windalco and others, and the rest of the commercial base shrinking at a similar pace
Water Supply and Irrigation	12.26%	11.79%	Share and volume both down (-9.1%) — broad, not company-specific
(industry not yet assigned)	11.64%	12.75%	Share rising slightly, because the small-business accounts with no industry assigned fell less than the others — an assignment gap more than a finding

Cement Manufacturing is the one genuinely clean growth story here: both the dollars and the share are moving up together, which is what real growth looks like rather than growth-by-comparison. Hotels is the mirror image — an outright decline, not just a shrinking share because other things grew around it. And about one kWh in eight still has no industry assigned, concentrated in small-business accounts, which caps how far the sector cut can be trusted until that is cleaned up.

5b. Concentration — how much of this sits with a handful of accounts?

Taking RT50 as the sharpest example, since it has the steepest volume decline of any class: year to date, the largest declines are Jamaica Broilers Group (-10.6 GWh) and four hotel and resort properties — X Fund Properties (-5.5), Sandals Whitehouse (-5.0), HOCATSA (-3.2) and Royal Caribbean Sea Club (-2.3). The largest gain is Caribbean Cement at +11.5 GWh, well ahead of the next biggest, West Meat Packers and Windalco (+1.7 and +1.5). Two items need care: Jamaica Broilers Group stepped down in mid-2025, so most of

its year-to-date gap is a base effect and September itself is only about 13% below last year; and Falmouth PHR (a further –6.2 GWh in RT50) did not decline at all but moved to RT70. That's the pattern across every class this analysis touched: the movement is a small number of large accounts, not a broad shift across the customer base.

6. Customer Defection

A commercial customer is treated as defecting when its consumption for January to September 2026 is more than 80% below the same period of 2025. On that definition 849 customers qualify, with a combined 2025 volume of 13.9 GWh that has fallen to 1.4 GWh — a loss of 12.5 GWh, or about 0.9% of commercial volume and roughly 16% of the 80 GWh decline in commercial sales. Defection is real but small; most of the decline in the commercial base comes from customers that reduced volume without leaving.

Each defection is classified as operational (a business that closed, was damaged or released capacity) or self-generation (a customer that now supplies itself but stays connected), based on when the drop occurred and whether the customer kept its contracted demand.

Likely cause	Customers	GWh Jan–Sep 2025	GWh Jan–Sep 2026	GWh lost	Share of loss
Storm window, not recovered	475	4.23	0.09	–4.14	33%
Storm window, recovering	54	4.97	0.97	–4.00	32%
Account closed	78	1.82	0.05	–1.77	14%
Contracted capacity released (outside the storm window)	4	1.64	0.19	–1.45	12%
Small business, no clear signal	236	1.08	0.09	–0.99	8%
Self-generation indicated	2	0.18	0.01	–0.17	1%
Total	849	13.92	1.40	–12.52	100%

About 91% of the volume lost to defection is operational, and most of it is storm-related: customers whose consumption fell away in the two months after the hurricane and have not come back, plus 54 that are recovering. Only two customers carry the self-generation signature of near-zero kWh with grid capacity held, and together they account for under 2% of the loss; one of them is JPS's own generating-station account rather than a customer. The four customers that released contracted capacity outside the storm window (Carib Products, Dougall Flooring and two others) are the ones to confirm directly, since a capacity cut can also follow a move to on-site generation. Alcoa does not appear here because it ran at normal volume for the first seven months of 2026, so its year-to-date total is down only 15%; on its current run rate (about 0.8 GWh a month against 7 to 9 before) it is down about 91%, and it is the one large, confirmed self-generation case in the base.

Largest defecting customers (2025 volume of 0.1 GWh or more)

Customer	Industry	GWh 2025	GWh 2026	Change	Likely cause
HOCATSA Jamaica Limited	Hotels	3.98	0.79	-80%	Storm damage; hotel now recovering month by month
Carib Products Co Ltd	Fats and oils refining	1.00	0.13	-87%	Volume and contracted demand both cut from February 2026; operational
United Call Solutions (Jamaica)	Contact centers	0.90	0.00	-100%	Storm window; demand cut to the minimum, site closed
Coyaba Beach Resort & Club	Hotels	0.69	0.13	-81%	Storm damage; recovering
Contax360 BPO Solutions	Contact centers	0.52	0.00	-100%	Storm window; demand cut to the minimum, site closed
BBNH Resorts Limited	Hotels	0.51	0.00	-100%	Storm window; no longer billing
M & W Investments Ltd	Banking, insurance and investments	0.38	0.03	-91%	Account closed; no billing since February 2026
Shoppers Fair	Supermarkets and grocery	0.34	0.00	-99%	Storm window; demand cut to the minimum
Unique Vacations Ltd	Contact centers	0.31	0.03	-90%	Storm window; no billing since April 2026
24-7 Intouch JAM2 Inc	Industry not yet assigned	0.27	0.02	-92%	Storm window; account closed
Strobe Communications Ltd	Contact centers	0.27	0.01	-96%	Storm window; demand cut to the minimum
Eight Rivers Energy Company	Hydroelectric power generation	0.27	0.00	-99%	Storm window; a generator, so confirm whether it now supplies itself
Dougall Flooring Ltd.	Flooring contractors	0.23	0.02	-91%	Volume and contracted demand run down gradually; operational
White Diamond Hotels & Resorts	Hotels	0.20	0.00	-100%	Storm window; no longer billing
St James Parish Council	Industry not yet assigned	0.12	0.00	-98%	Storm window; consumption near zero
AMGL Account Outsourcing Group	Industry not yet assigned	0.12	0.01	-94%	Storm window; account closed
Jamaica Public Service Co. Ltd	Hydroelectric power generation	0.10	0.00	-101%	JPS's own generating-station account, not a customer defection

Cause is an indicator, not a confirmation. The 236 small-business customers in "no clear signal" carry no demand charge, so the demand test cannot be applied to them.

Key Questions

How are we performing from a sales perspective? Growing, declining, or flat?

Declining in volume (-4.7% YTD), growing in customer count (+1.5%), close to flat in revenue (-1.5%, cushioned by the rate increase). September sales were down 2.3% (1.8% after adjusting for billing timing at Caribbean Broilers) and revenue was up 0.8%. See Section 1.

What customer class is driving sales and peak-demand changes? What are the drivers? Where are the shortfalls?

RT50 and RT60-ST have the steepest percentage volume declines (−9.6% and −9.5%); RT70 has the steepest customer-count decline (−8.7%, two accounts), though one hotel moving from RT50 to RT70 in 2025 flatters RT70 and penalises RT50. Excluding Alcoa, billed demand across RT40, RT50 and RT70 is down 4.3% against kWh down 6.4%. See Sections 1b and 2.

Which customers explain the gains? Do these reflect business growth, new accounts, return to the grid, or billing adjustments?

Mostly new connections in count terms, but a large share of those are zero-consumption (Section 3), so they're not really adding load. The gains that do reflect real business growth are concentrated in a handful of named accounts — Caribbean Cement (+11.5 GWh year to date in RT50), the distilleries (+15%) — and in the upward migration of existing residential customers into higher bands, not broad-based growth across the customer file. Prepaid is the other clear gain, up 9% in volume.

Which customers explain lost sales? What is the cause, and when is demand expected to return, if so?

Three causes cover most of it: Alcoa's self-generation (RT70, permanent, not returning), the hotel sector's still-incomplete Hurricane Melissa recovery (temporary, closing gradually), and a handful of other large accounts such as Jamaica Broilers Group, whose volume stepped down in mid-2025. Outright defection, meaning customers down more than 80%, accounts for only about 16% of the commercial decline and is overwhelmingly storm-related (Section 6).

Where a rate class shows net growth or net decline overall, is that outcome driven mainly by new connections and closures rather than by existing customers, and could that be masking an underlying decline (or growth) among the existing customer base?

Yes, and this is the central finding of the whole exercise. Existing RT10 and RT20 customers are genuinely using more, moving into higher consumption bands, but that real growth is invisible in the blended per-customer average because it's being swamped by a wave of connections that use nothing at all. See Section 3.

Within each rate class, does the number of customers gaining vs. losing consumption align with the direction of net load change, or is the result being driven by a small number of accounts with disproportionately large swings?

A small number of accounts. See Section 5b — RT50's losses trace to a poultry group and four hotel properties (and one reclassified hotel), and its largest gain is a single cement account; Alcoa accounts for 9.8 GWh of RT70's 13.0 GWh year-to-date decline.

Which industries are growing or declining, and why? Are changes widespread or concentrated in a few customers/classes?

Concentrated. Hotels alone outweighs the next three declining industries combined. See Section 5.

Within industries, how is the composition of demand changing? Does a higher share reflect growth or declines elsewhere?

Mixed, and worth distinguishing case by case: Cement Manufacturing's rising share is real growth (volume and share both up together); Hotels' falling share is a genuine decline, not dilution by faster-growing peers. See Section 5a.

Where is demand loss concentrated? Which Rate Class? Which consumption bucket?

By class, RT50 and RT60-ST. By consumption bucket, RT10's two lowest bands are losing customers even as everyone who remains in the higher bands uses more. By geography, the western parishes — Westmoreland, St. Elizabeth, Hanover, Trelawny and St. James — carry the whole of the residential volume decline. See Sections 3 and 4.

Is charging demand growing through more accounts or greater usage? Which operators are driving the increase?

Growing quickly, and mostly through greater usage per site rather than more sites. Billing under the EV tariff rose from 11.4 MWh in September 2025 to 68.9 MWh in September 2026 (6.1 times), and revenue from J\$0.44 million to J\$2.48 million. Sites went from 20 to 26, but average use per site rose from about 569 kWh to about 2,652 kWh a month. January–September volume is 444 MWh against 76 MWh a year earlier. The step-up came in January 2026 (12.8 MWh in December to 36.6 MWh in January on just two more sites), which suggests higher-capacity chargers coming into service, and it has climbed every month since March. Every EV-tariff site is billed to JPS itself, across the parishes, so today the growth is JPS's own charging network; no third-party operator has a site on the EV tariff. Chargers run by other operators, such as Evergo, that are metered on ordinary commercial tariffs cannot be separated from other commercial load. The volume is still tiny — 0.02% of monthly system sales — and earns about J\$36.0 per kWh against a system average near J\$53.

How quickly is self-generation growing? How does it affect grid purchases, and how much activity sits outside registered net billing? For declining accounts, is the reduction due to lower usage while remaining connected versus full disconnection from the grid?

Solar shows up in two ways. Customers registered on the net-billing tariff number 895 (518 residential, 312 small business, 65 large commercial) and are growing slowly, up 5.3% in a year. But customers who actually exported more than they drew in September number 1,145 across the two residential tariffs, close to double the registered residential count, and are up 124% (RT10) and 98% (RT20) year over year — so at least 508 residential exporters sit outside registered net billing, and that group is where the growth is. The pattern is seasonal, with fewer exporters in summer, but the summer base is now about 62% higher than a year ago. Among commercial customers, the 849 that cut consumption by more than 80% are overwhelmingly operational (storm closures, releases of contracted capacity); only two carry the self-generation signature, and one of those is JPS's own account (Section 6). Alcoa's exit is the one large, clear self-generation case: a full one-month departure from grid draw (9 GWh to 1.3), not a gradual export pattern, and it still runs about 0.8 GWh a month. Commercial exporters are rare (39 small-business accounts and 4 on RT40 to RT70 in September) and commercial net-billing accounts are flat. See Sections 3 and 6 and Appendix A9.

How are demand changes affecting revenue across rate classes?

Far more gently than the volume numbers suggest — system-wide, -1.5% revenue against -4.7% volume, because the average rate rose 3.4% and absorbed most of the difference. For commercial customers there is a second cushion: demand charges are billed on peak kVA, which doesn't fall in step with kWh, so across RT40, RT50 and RT70 (excluding Alcoa) volume is down 6.4% and the energy charge 6.1% while billed kVA is down 4.3%. RT70 revenue is actually up despite selling less power, partly because of Alcoa's provisional demand charges. See Sections 1b and 2.

Which industries now contribute the most revenue? How does an industry or rate-class change compare in scale to the overall system-level change — is it disproportionately responsible relative to its size?

Hotels lost 25.2% of its volume but only 19.7% of its revenue — a favorable rate or mix shift cushioned some of the blow. Water Supply shows the same pattern at a smaller scale (9.1% of volume, 4.0% of revenue). See Section 5.

What is happening within key customer businesses? Which changes are temporary disruptions versus sustained changes in grid demand?

Temporary: the hotel sector's Melissa recovery, which is closing gradually. Sustained: Alcoa's self-generation, which is a permanent reduction in grid draw, not a dip that reverses. Alcoa's billed demand is provisional and will be adjusted down, so its remaining revenue should not be read as retained capacity.

Is average revenue per kWh changing?

Yes, and it's the main reason revenue held up better than volume — the system-wide blended rate rose from J\$50.91/kWh to J\$52.63/kWh, +3.4%. Every rate class saw its own rate rise over the period; RT70 (+7.8%) and RT40 (+4.9%) moved the most. The split by non-fuel, fuel, IPP and taxes is in Section 1b: fuel drives the increase, while the non-fuel rate is roughly flat.

Appendix

Supporting tables for the sections above. Unless stated, figures are September 2025 against September 2026, or January to September for year-to-date measures. Sales are billed kWh; revenue is net billed revenue before GCT.

A1. Segment build-up of the combined figures

Customers	Sep 2025	Sep 2026
Residential — billed monthly	684,820	695,004
Prepaid	16,930	18,415
Commercial	26,762	26,011
Combined	728,512	739,430

Sales and revenue, Jan–Sep	Residential	Prepaid	Commercial	Combined
Sales 2025 (GWh)	1,080.9	21.2	1,447.9	2,550.0
Sales 2026 (GWh)	1,038.1	23.1	1,367.7	2,428.9
Net revenue 2025 (J\$M)	62,369	1,180	66,276	129,824
Net revenue 2026 (J\$M)	61,267	1,367	65,205	127,839

A2. Consumption bands — RT10 residential

Band (kWh per month)	Customers Sep-25	Customers Sep-26	Change	GWh Sep-25	GWh Sep-26
Net export (below zero)	459	1,026	+567 (+123.5%)	−0.10	−0.26
Zero consumption	50,935	59,039	+8,104 (+15.9%)	0.00	0.00
Under 150	319,694	316,084	−3,610 (−1.1%)	24.45	23.60
150 to 350	203,349	198,768	−4,581 (−2.3%)	45.17	44.43
350 to 550	39,140	42,778	+3,638 (+9.3%)	16.75	18.38
550 to 750	11,821	13,969	+2,148 (+18.2%)	7.48	8.85
750 to 950	4,704	5,744	+1,040 (+22.1%)	3.93	4.81
Over 950	6,013	7,121	+1,108 (+18.4%)	10.08	11.75
Prepaid	16,412	17,898	+1,486 (+9.1%)	2.51	2.90
Total	652,527	662,427	+9,900 (+1.5%)	110.28	114.45

A3. Consumption bands — RT20 residential (small residential-type accounts)

Band (kWh per month)	Customers Sep-25	Customers Sep-26	Change	GWh Sep-25	GWh Sep-26
Net export (below zero)	60	119	+59 (+98.3%)	-0.04	-0.12
Zero consumption	5,704	6,480	+776 (+13.6%)	0.00	0.00
Under 150	18,828	18,898	+70 (+0.4%)	1.12	1.11
150 to 350	10,071	10,014	-57 (-0.6%)	2.36	2.36
350 to 550	4,657	4,753	+96 (+2.1%)	2.05	2.09
550 to 750	2,472	2,640	+168 (+6.8%)	1.59	1.70
750 to 950	1,593	1,658	+65 (+4.1%)	1.34	1.39
Over 950	5,320	5,913	+593 (+11.1%)	12.32	14.88
Prepaid	518	517	-1 (-0.2%)	0.10	0.11
Total	49,223	50,992	+1,769 (+3.6%)	20.83	23.52

RT10 and RT20 residential use the standard residential bands. Customers in the prepaid line are also counted in the totals but have no band; net export means the customer sent more solar to the grid than it drew that month.

A4. Consumption bands — RT20 commercial (small business, individually metered)

Band (kWh per month)	Customers Sep-25	Customers Sep-26	Change	GWh Sep-25	GWh Sep-26
Net export (below zero)	14	39	+25 (+178.6%)	-0.01	-0.03
Zero consumption	2,001	2,099	+98 (+4.9%)	0.00	0.00
1 to 1,000	14,780	14,083	-697 (-4.7%)	4.01	3.85
1,001 to 5,000	5,743	5,557	-186 (-3.2%)	12.85	12.44
5,001 to 20,000	1,515	1,502	-13 (-0.9%)	13.83	13.61
20,001 to 100,000	192	200	+8 (+4.2%)	6.42	7.00
100,001 to 500,000	3	2	-1 (-33.3%)	0.35	0.24
Total	24,248	23,482	-766 (-3.2%)	37.44	37.10

A5. Consumption bands — RT40 Commercial

Band (kWh per month)	Customers Sep-25	Customers Sep-26	Change	GWh Sep-25	GWh Sep-26
Net export (below zero)	1	2	+1 (+100.0%)	-0.12	-0.01
Zero consumption	21	34	+13 (+61.9%)	0.00	0.00
1 to 1,000	84	95	+11 (+13.1%)	0.04	0.04
1,001 to 5,000	220	213	-7 (-3.2%)	0.66	0.65
5,001 to 20,000	753	737	-16 (-2.1%)	8.68	8.48
20,001 to 100,000	713	740	+27 (+3.8%)	31.28	32.30
100,001 to 500,000	147	137	-10 (-6.8%)	24.27	23.52
Over 500,000	5	4	-1 (-20.0%)	4.15	2.33
Total	1,944	1,962	+18 (+0.9%)	68.94	67.31

A6. Consumption bands — RT50 Large Commercial

Band (kWh per month)	Customers Sep-25	Customers Sep-26	Change	GWh Sep-25	GWh Sep-26
Net export (below zero)	2	2	0 (0.0%)	-0.12	0.00
Zero consumption	4	8	+4 (+100.0%)	0.00	0.00
1 to 1,000	3	1	-2 (-66.7%)	0.00	0.00
1,001 to 5,000	4	9	+5 (+125.0%)	0.01	0.03
5,001 to 20,000	21	19	-2 (-9.5%)	0.27	0.26
20,001 to 100,000	60	59	-1 (-1.7%)	2.93	2.94

Over 500,000	2	2	0 (0.0%)	1.50	1.50
Total	388	388	0 (0.0%)	3.41	3.41

A8. Consumption bands — RT70 Industrial

Band (kWh per month)	Customers Sep-25	Customers Sep-26	Change	GWh Sep-25	GWh Sep-26
Zero consumption	2	1	-1 (-50.0%)	0.00	0.00
1 to 1,000	2	0	-2 (-100.0%)	0.00	0.00
1,001 to 5,000	0	1	new	0.00	0.00
100,001 to 500,000	1	2	+1 (+100.0%)	0.42	0.70
Over 500,000	18	17	-1 (-5.6%)	26.86	17.94
Total	23	21	-2 (-8.7%)	27.28	18.64

Commercial and industrial classes are individually metered, so the bands are set on each account's monthly kWh rather than the residential bands. Zero-consumption accounts that are not mapped to any rate class are left out of the class tables; the volume involved is nil.

A9. Net billing — registered customers against customers exporting in the month

Registered on the net-billing tariff	Sep 2025	Dec 2025	Sep 2026	Change
Residential (NB10)	484	488	518	+34 (+7.0%)
Small business (NB20)	301	302	312	+11 (+3.7%)
Large commercial (NB40)	65	64	65	0 (0.0%)
Total registered	850	854	895	+45 (+5.3%)

Customers exporting more than they drew, in September	Sep 2025	Sep 2026	Change
RT10 residential	459	1,026	+567 (+123.5%)
RT20 residential	60	119	+59 (+98.3%)
RT20 commercial	14	39	+25 (+178.6%)
RT40 to RT70 commercial	3	4	+1 (+33.3%)

Registered net-billing customers, on average, still draw more from the grid than they export, so they are not the same population as customers in net export in a given month. Exporters are seasonal: they peak in the low-consumption winter months and trough in summer, so September is best compared with September.

RT50 and RT70 have no registered net-billing customers. Their negative-kWh months since January 2025 (46 account-months) come almost entirely from power producers selling to the grid: Wigton Windfarm (15), West Kingston Power Partners (6), Jamaica Energy Partners (5), NFE South Power Holdings (4), Jamaica Private Power Company (2), BMR Jamaica Wind (2), South Jamaica Power Company (2), Eight Rivers Energy (1). The remaining 9 (Jamaica Public Service Co. Ltd, Montego Bay Yacht Club, Palm Rose Commodity Limited, West Meat Packers Ja Ltd) are reversals or station-service entries rather than exports.

A10. Demand-billed classes excluding Alcoa — volume, billed demand and charges, January to September

Class	GWh	Billed kVA (thousands)	Energy charge (J\$M)	Demand charge (J\$M)
RT40 Commercial	605.3 → 568.1	2,325 → 2,234	4,086 → 3,846	5,862 → 5,650
RT50 Large Commercial	285.8 → 258.3	1,528 → 1,427	1,384 → 1,254	1,952 → 1,809
RT70 Industrial (excluding Alcoa)	162.0 → 158.8	738 → 734	812 → 797	1,389 → 1,366
All three	1,053.1 → 985.2	4,591 → 4,396	6,283 → 5,898	9,203 → 8,825

Alcoa is excluded because its billed demand for August and September is provisional and will be adjusted down. September figures for RT40 also carry a billing-timing distortion at one large account (Caribbean Broilers).

A11. Definitions

- **Residential — billed monthly:** RT10 homeowner accounts and the residential-type accounts on RT20, billed after use. **Prepaid:** pay-as-you-go accounts on RT10 and RT20, reported separately. **Commercial:** RT20 accounts registered as businesses, plus RT40, RT50, RT60-ST and RT70.
- **Customers** are billed accounts in the month, one per metered account for commercial. **Sales** are billed kWh. **Revenue** is net billed revenue before GCT, which is shown separately.
- **Non-fuel charges** are the customer charge, energy charge and (commercial only) demand charge; **fuel** and **IPP** are the pass-through charges; **other** is what remains between the sum of those charges and net revenue (billing adjustments and credits).
- **Defecting customer:** a commercial customer whose January–September consumption is more than 80% below the same period of the prior year.
