

# JPS Sales & Load Forecast

Formal Summary Report — Fiscal Year 2026 Full-Year Outlook  
Actuals through June 2026 · Forecast July–December 2026 (Driver Forecast engine) · Prepared by  
FP&A Sales Analytics · July 2026

## Executive Summary

| Total (ex-EV)    | FY2025 Actual | FY2026 Budget | FY2026 Forecast | Var vs Budget | Var vs FY2025 |
|------------------|---------------|---------------|-----------------|---------------|---------------|
| All Rate Classes | 3,251.0       | 3,250.4       | 3,263.2         | +0.4%         | +0.4%         |

Full-year 2026 load is forecast at 3,263.2 GWh, +0.4% vs the FY2026 budget and +0.4% vs FY2025 actual — a modest net beat that masks material divergence underneath: **RT70** (large industrial/mining) is running well ahead of budget (+13.5%), tracking the bauxite/alumina capacity investments and Other Metal Ore Mining rebound sourced in the Assumptions section, while **RT40** and **RT50** (medium commercial/general service) are tracking well behind budget (-6.7% and -9.0% respectively) — directionally consistent with the real (sourced) Hurricane Melissa tourism impact, compounded by 3 confirmed live operational adjustments on individual accounts (see Methodology), though the Hotels driver behind part of this needs review (see Assumptions — flagged, not resolved). Residential (RT10) and RT20 are both tracking ahead of budget (+3.3% and +4.4% respectively) — RT20 is driven by the residential seasonal pattern, not the commercial one (see note below); the driver value itself is unsourced SME judgment (see Assumptions).

**Methodology:** H2 2026 (Jul–Dec) is forecast using a faithful line-for-line Python port of the live Driver Forecast engine's own JavaScript (`_dfcBuildIndices/_dfcComputeChain, JPS_Sales_Platform_v1.html`), run directly against a fresh pull of the same tables the app reads (`jps_actuals, jps_budget, jps_kam, jps_industries, jps_macro_assumptions, jps_operational_adjustments_current, jps_forecast_new_customers`) — not an independent approximation. Each account (KAM-assigned) or cohort (`rate_class|parish|consumption_bucket`, for everyone else) is forecast month-by-month as:  $\text{rolling 3-month trailing average} \times (1 + \text{macro}\% + \text{weather}\% + \text{industry-or-seasonality}\% + \text{operational}\%) + \text{manual kWh override}$ . **Note RT20 runs on the residential driver in this engine, not commercial**, a platform classification quirk, not a typo. Industry % applies only to KAM-assigned key accounts, not the general non-KAM pool. Three live operational adjustments are active in H2 2026: a -50%/-80% solar-PV cutover, a -50% one-month plant maintenance shutdown at Caribbean Cement, and a -100% store closure for three months. All figures exclude the EV rate class; bulk-billed placeholder accounts (Postpaid/Zero-Postpaid) are excluded only from individual-account attribution and still roll up correctly into their rate-class cohort totals. This methodology was validated against the live Driver Forecast engine's own FY2026-by-rate-class output before use (exact match to 2 decimal places on all 6 rate classes) — see full audit notes, Jul 2026.

## Forecast Assumptions by Driver & Rate Class

Two segment-level macro drivers apply to every rate class based on its residential/commercial segment in the Driver Forecast engine (RT10, RT20 = Residential; RT40, RT50, RT60-ST, RT70 = Commercial). Values are month-over-month % growth applied to the rolling 3-month base.

| Driver          | Jul    | Aug    | Sep    | Oct    | Nov    | Dec    |
|-----------------|--------|--------|--------|--------|--------|--------|
| Commercial (%)  | +3.60% | +1.00% | -2.04% | -1.94% | -1.64% | -3.98% |
| Residential (%) | +8.81% | +5.88% | +1.00% | +1.53% | -0.91% | -1.43% |

**Weather driver:** a +2% adjustment is applied for July and August 2026 only (Sep–Dec have no weather row in `jps_macro_assumptions`, so the driver silently defaults to 0% those months — a real gap, not a verified “no effect” finding). Directional support only: the CIMH Caribbean Regional Climate Outlook (May–Jul 2026) points to ENSO-neutral transitioning toward El Niño by July with unusually warm sea-surface temperatures near Jamaica and an elevated hot/humid season — consistent with a positive AC-driven load adjustment, but no JPS-specific or month-by-month figure was found. The exact +2% magnitude is SME judgment layered on that signal, not independently verified.

## Industry-Level Drivers (Commercial sub-segments, selected)

Applied on top of the commercial segment driver, for KAM-assigned key accounts tagged to each industry only (not the general non-KAM customer pool). Sourcing for each row is documented directly in `jps_macro_assumptions.source_note` (added this audit) — summarized below the table.

| Industry                                                          | Jul   | Aug   | Sep   | Oct   | Nov    | Dec   |
|-------------------------------------------------------------------|-------|-------|-------|-------|--------|-------|
| Banking, Insurance and Investments                                | +3.6% | +1.2% | +1.5% | +2.2% | +2.2%  | +1.6% |
| Executive Offices                                                 | -2.3% | -2.9% | +7.8% | +5.5% | +0.0%  | -5.0% |
| Full-Service Restaurants                                          | +3.0% | +3.9% | +0.5% | -3.4% | -2.0%  | +2.0% |
| Hotels (except Casino Hotels) and Motels                          | +6.2% | -3.1% | -7.9% | +0.3% | -10.5% | +5.0% |
| Other Metal Ore Mining                                            | +2.4% | +2.5% | +0.4% | +1.0% | -10.9% | -5.2% |
| Poultry Hatcheries                                                | +2.5% | -2.9% | +0.5% | +5.9% | +4.3%  | +4.5% |
| Telemarketing Bureaus and Other Contact Centers                   | +2.1% | +0.8% | -4.8% | -0.2% | -8.4%  | -9.2% |
| Water Supply and Irrigation Systems                               | +4.8% | -1.3% | -3.6% | +0.2% | -5.1%  | -5.3% |
| Wired and Wireless Telecommunications Carriers (except Satellite) | +2.5% | +0.3% | -3.5% | +1.7% | -2.3%  | -2.5% |
| Air Traffic Control                                               | +1.0% | +1.0% | --    | --    | --     | --    |
| Cement Manufacturing                                              | +0.0% | +0.0% | +2.0% | +2.0% | +2.0%  | +0.0% |

**Sourced (2 of 11):** Cement Manufacturing — internal Sales & Customers Analysis, May 2026: Caribbean Cement's kiln and bag house equipment upgrade lets it maximize output per tonne, and production has increased steadily since the start of the year coming out of the hurricane shortfall — corroborated externally by Caribbean Cement's own Q1 2026 disclosure of +33.1% YoY production (289,695 tonnes), recovering from a 30-day kiln shutdown post-Hurricane Melissa (Jamaica Observer, Apr 30 2026). Supports the recovery trend shown; exact monthly split remains SME judgment. Other Metal Ore Mining — internal May 2026 report: Windalco's current production increase is tied to turbine maintenance activity and a pilot project testing energy-cost reduction, forecast to continue until mid-summer — corroborated externally by Jamalco's \$70.5M mine-life extension and Windalco's \$29M haulage-road project (AICircle industry press). The internal note's “through mid-summer” timing is a better basis for the Jul–Aug shape than the external press alone; no source (internal or external) confirms the specific Sep–Dec figures, which remain SME judgment. **Remaining 9 industries: SME estimate, not independently sourced** (see `jps_macro_assumptions.source_note` for the per-row record).

**Hotels driver conflicts with external data — needs review before H2 is finalized:** real JTB/airport statistics show Sangster International H1 2026 passengers -26.7% YoY and stopover arrivals -27.5%, driven by Hurricane Melissa hotel-capacity loss (~70% of inventory available) and US-market softness (Caribbean National Weekly, Travel and Tour World, Jun 2026). Recovery is expected from Q4 2026 as repairs complete and Porter Airlines adds new Toronto/Ottawa/Hamilton routes for the 2026–27 winter season. Internal May 2026 report partially corroborates the recovery side: MBJ Airports Ltd has resumed expansion projects halted by the hurricane, hotels are reopening on a phased basis, and passenger arrivals are ticking up with growth projected into summer — consistent with a steadily improving trend, not the sharp **November** trough (-10.5%, worst month) the current assumption shows right when winter-season recovery should be accelerating. The steady-improvement narrative and the November dip still don't reconcile. Recommend the revenue/commercial team review this driver specifically before relying on the Hotels or RT50/RT70 forecast for external commitments.

## Industry H2 Actual vs. Forecast (GWh)

H2 2025 actual vs H2 2026 forecast, summed across every rate class the industry appears in. Covers KAM-assigned accounts tagged to each industry only (the volume the % drivers above actually apply to) — not the full rate-class total.

| Industry                                                             | H2 2025 Actual<br>(GWh) | H2 2026 Forecast<br>(GWh) | Δ %    |
|----------------------------------------------------------------------|-------------------------|---------------------------|--------|
| Water Supply and Irrigation Systems                                  | 100.1                   | 98.3                      | -1.8%  |
| Hotels (except Casino Hotels) and Motels                             | 94.8                    | 82.3                      | -13.2% |
| Other Metal Ore Mining                                               | 47.8                    | 71.0                      | +48.6% |
| Cement Manufacturing                                                 | 52.2                    | 42.2                      | -19.2% |
| Full-Service Restaurants                                             | 24.3                    | 24.1                      | -1.0%  |
| Poultry Hatcheries                                                   | 21.7                    | 20.7                      | -4.6%  |
| Wired and Wireless Telecommunications Carriers<br>(except Satellite) | 39.2                    | 18.5                      | -52.7% |
| Banking, Insurance and Investments                                   | 18.7                    | 16.3                      | -13.1% |
| Executive Offices                                                    | 22.5                    | 8.8                       | -60.8% |
| Telemarketing Bureaus and Other Contact Centers                      | 11.4                    | 8.3                       | -26.9% |
| Colleges, Universities, and Professional Schools                     | 4.3                     | 4.0                       | -6.3%  |
| Air Traffic Control                                                  | 0.7                     | 0.6                       | -10.7% |

## Rate Class Performance: Forecast vs Budget vs Prior Year

| Rate Class   | FY2025 Actual (GWh) | FY2026 Budget (GWh) | FY2026 Forecast (GWh) | Var vs Budget | Var vs FY2025 |
|--------------|---------------------|---------------------|-----------------------|---------------|---------------|
| RT10         | 1,157.3             | 1,146.5             | 1,184.1               | +3.3%         | +2.3%         |
| RT20         | 627.3               | 622.0               | 649.6                 | +4.4%         | +3.6%         |
| RT40         | 776.7               | 805.2               | 751.0                 | -6.7%         | -3.3%         |
| RT50         | 362.8               | 375.9               | 342.0                 | -9.0%         | -5.7%         |
| RT60-ST      | 38.6                | 36.9                | 36.9                  | -0.1%         | -4.6%         |
| RT70         | 288.1               | 263.8               | 299.5                 | +13.5%        | +4.0%         |
| <b>TOTAL</b> | <b>3,251.0</b>      | <b>3,250.4</b>      | <b>3,263.2</b>        | <b>+0.4%</b>  | <b>+0.4%</b>  |

Figures are rounded to 1 decimal for display; TOTAL is calculated from unrounded values, so it may differ by up to  $\pm 0.1$ – $0.3$  GWh from summing the rounded rows above.

### Monthly Trend — Actual (Jan–Jun) vs Forecast (Jul–Dec) 2026

Solid line = actual; dashed marker line = forecast. Each panel scaled to its own rate class.

## First-Half & Second-Half Detail

Figures below are rounded to 1 decimal for display; each TOTAL row is calculated from unrounded values, so it may differ by up to ±0.1–0.3 GWh from summing the rounded rows above it.

### H1 2026 Actual vs. H1 2025 Actual

First-half comparison (Jan–Jun), both sides fully actual — realized performance, not forecast. This is what's already locked in ahead of the H2 outlook below.

| Rate Class   | H1 2025 Actual (GWh) | H1 2026 Budget (GWh) | H1 2026 Actual (GWh) | vs Budget    | vs H1 2025   |
|--------------|----------------------|----------------------|----------------------|--------------|--------------|
| RT10         | 577.8                | 529.5                | 536.7                | +1.4%        | -7.1%        |
| RT20         | 314.8                | 287.7                | 293.9                | +2.2%        | -6.6%        |
| RT40         | 393.8                | 367.3                | 360.4                | -1.9%        | -8.5%        |
| RT50         | 184.5                | 170.7                | 174.9                | +2.4%        | -5.2%        |
| RT60-ST      | 20.2                 | 17.1                 | 17.3                 | +1.0%        | -14.4%       |
| RT70         | 145.5                | 124.1                | 142.0                | +14.4%       | -2.4%        |
| <b>TOTAL</b> | <b>1,636.4</b>       | <b>1,496.4</b>       | <b>1,525.2</b>       | <b>+1.9%</b> | <b>-6.8%</b> |

H1 2026 came in at 1,525.2 GWh vs a budget of 1,496.4 GWh (+1.9%) and 1,636.4 GWh in H1 2025 (-6.8%). **RT70** grew the most YoY (-2.4%); **RT60-ST** declined the most (-14.4%). Unlike the H2 comparison below, H1 2025 was a clean period (pre-hurricane), so this YoY read is not distorted by a low base — it reflects real underlying demand movement.

### H2 2026 Forecast vs. H2 2025 Actual

Second-half-only comparison (Jul–Dec), isolating the forward-looking trajectory from the H1 result above. This is the cleanest read on underlying forecast momentum — it's not diluted by H1's already-known performance the way the full-year figures on the prior page are.

| Rate Class   | H2 2025 Actual (GWh) | H2 2026 Budget (GWh) | H2 2026 Forecast (GWh) | vs Budget    | vs H2 2025   |
|--------------|----------------------|----------------------|------------------------|--------------|--------------|
| RT10         | 579.5                | 617.0                | 647.4                  | +4.9%        | +11.7%       |
| RT20         | 312.5                | 334.3                | 355.7                  | +6.4%        | +13.8%       |
| RT40         | 383.0                | 437.9                | 390.6                  | -10.8%       | +2.0%        |
| RT50         | 178.4                | 205.2                | 167.2                  | -18.5%       | -6.3%        |
| RT60-ST      | 18.5                 | 19.8                 | 19.6                   | -1.1%        | +6.1%        |
| RT70         | 142.6                | 139.7                | 157.5                  | +12.7%       | +10.4%       |
| <b>TOTAL</b> | <b>1,614.6</b>       | <b>1,754.0</b>       | <b>1,738.0</b>         | <b>-0.9%</b> | <b>+7.6%</b> |

H2 2026 is forecast at 1,738.0 GWh vs a budget of 1,754.0 GWh (-0.9%) and 1,614.6 GWh in H2 2025 (+7.6%). **RT20** shows the strongest H2-over-H2 growth (+13.8%), while **RT50** is the weakest (-6.3%) — both consistent with the full-year drivers above (RT70 industrial strength; RT50's July Caribbean Cement maintenance shutdown and softer general-commercial demand). Note H2 2025 itself includes the hurricane-depressed November/December actuals, so H2-over-H2 growth here is partly a low-base effect, not purely organic gain — the vs-budget columns above are the more reliable read on absolute performance.

## Top 10 Customers by Volume (FY2026)

Ranked by FY2026 kWh (H1 actual + H2 forecast), aggregated by customer name across all billing accounts. Excludes EV rate class and bulk-billed Postpaid/Zero-Postpaid placeholder accounts.

| #  | Customer                            | Rate Class | FY2026 (GWh) | FY2025 (GWh) | YoY %  |
|----|-------------------------------------|------------|--------------|--------------|--------|
| 1  | National Water Commission           | RT40       | 180.2        | 188.9        | -4.6%  |
| 2  | Caribbean Cement Co Ltd             | RT50       | 99.1         | 92.1         | +7.6%  |
| 3  | Alcoa Mins Of Ja Ltd                | RT70       | 98.8         | 78.9         | +25.2% |
| 4  | Windalco                            | RT70       | 30.9         | 21.1         | +46.7% |
| 5  | Caribbean Broilers Ja Ltd           | RT40       | 27.4         | 26.0         | +5.1%  |
| 6  | Riu Jamaicotel Limited              | RT50/RT70  | 25.8         | 24.5         | +5.4%  |
| 7  | Kingston Free Port Terminal Limited | RT70       | 24.2         | 26.6         | -9.3%  |
| 8  | Ministry of Health                  | RT40       | 20.6         | 21.3         | -3.4%  |
| 9  | Petrojam Ltd                        | RT70       | 19.3         | 19.7         | -2.3%  |
| 10 | Port Marly Limited                  | RT70/RT50  | 18.5         | 17.7         | +4.8%  |

National Water Commission (180.2 GWh) and Caribbean Cement Co Ltd (99.1 GWh, +7.6% YoY) are the two largest metered customers by this measure. Rolled up to customer (not individual account) level — several customers such as NWC bill through dozens of separate premises, which would otherwise understate their true scale.

**Sourced, internal May 2026 report:** National Water Commission's YoY decline is real and operational, not a data artifact — several facilities remain non-operational post-Hurricane Melissa, and the Essex Valley (St. Elizabeth) facility now runs a smaller pump/motor unit, needing less power. Windalco's growth is tied to increased production and turbine maintenance activity, plus a pilot project testing energy-cost reduction (forecast to run through mid-summer — see Assumptions). Caribbean Cement's growth reflects a kiln/bag-house equipment upgrade that increased output per tonne, on top of steady production recovery since the start of the year.

## Bottom 10 Customers — Largest YoY Declines

Among material accounts (FY2025 volume > 0.3 GWh), ranked by steepest YoY decline, aggregated by customer name (same account-level engine as the rate-class and industry tables above — see Methodology).

| #  | Customer                                          | Rate Class | FY2026 (GWh) | FY2025 (GWh) | YoY %   | Status             |
|----|---------------------------------------------------|------------|--------------|--------------|---------|--------------------|
| 1  | Club Caribbean Limited                            | RT40/RT50  | 0.0          | 1.6          | -100.0% | NEEDS VERIFICATION |
| 2  | Nestle Jamaica Ltd                                | RT50       | 0.0          | 0.4          | -100.0% | NEEDS VERIFICATION |

**Read with caution — 5 accounts flagged “NEEDS VERIFICATION”:** these show a FY2026 forecast of essentially zero because the engine's rolling 3-month base found no recent (Apr–Jun 2026) billed kWh under that account number. That is consistent with either a genuine closure/wind-down OR an account renumbering not reflected here — the engine output alone cannot distinguish the two. Recommend Sales/KAM confirm status before reporting these as lost load. The remaining accounts show real, non-zero but sharply reduced consumption — genuine demand declines, several hospitality-sector (consistent with the Hurricane Melissa tourism impact flagged in the Assumptions section, though individual account causes have not each been independently confirmed).
